

A black and white close-up portrait of an elderly man. He is wearing a white turban that is slightly frayed at the top. His face is heavily wrinkled, particularly around the eyes and forehead. He has a white beard and mustache. He is looking directly at the camera with a neutral expression. The background is dark and out of focus.

# **GLOBAL LINKS**

The Millennium Development Goals (MDGs) recognize that expanding international trade can help developing economies achieve the MDGs by fostering economic growth and increasing job opportunities. At the 2000 Millennium Summit developed countries agreed to increase market access for developing countries by lowering tariffs and granting tariff-free access to all goods (except weapons). They also agreed to increase aid for promoting trade and to decrease domestic agricultural subsidies that harm imports from developing economies.

The world today is a more integrated place than in 1990—the MDGs benchmark year. World exports of goods and services nearly tripled between 1990 and 2007—a 7 percent annual average growth rate—and foreign direct investment increased ninefold between 1990 and 2008. More people are moving abroad (temporarily or permanently), more investors are buying foreign stocks, and more companies are expanding to overseas markets. And developing economies' trade has expanded from 17.3 percent of world exports and 17.0 percent of world imports in 1990 to 28.1 percent of exports and 25.9 percent of imports in 2007.

Though all economies may benefit from international integration, the benefits may not be shared equally among them. Successful integration depends partly on geography and natural resources: economies with substantial coastal areas or located near large economic centers may increase their share of the global market much faster than landlocked or isolated economies. And economies with abundant natural resources and cheap labor may attract foreign investors and grow faster than economies with fewer resources.

The question remains: can trade expansion and economic integration promote human development? Trade expansion provides developing economies with a larger market in which to sell goods and services, boosting production. But trade liberalization can also harm domestic industries by exposing them to fierce international competition. Trade expansion can promote rapid economic growth, potentially furthering human development. But greater engagement with international markets is sometimes accompanied by increased income inequality. Developing economies must consider how integration affects the most vulnerable segments of the population. Increased trade can accelerate progress toward the MDGs only if it both fosters economic growth and improves living standards for the poorest and most vulnerable.

Four MDG indicators track developed economies' commitments to increase market access for developing economies and support their programs to promote trade: the proportion of total developed country imports (by value and excluding arms) admitted free of duty from developing economies and least developed countries; average tariffs imposed by developed economies on agricultural products, textiles, and clothing from developing economies; agricultural support in Organisation for Economic Co-operation and Development (OECD) economies as a percentage of their gross domestic product (GDP); and the share of official development assistance provided to build trade capacity.

But these indicators are not enough to describe the many instruments of trade policy, the changing patterns of trade, and their impact on human development. This introduction looks beyond the MDG indicators to the characteristics of economies and their trade policies that may ultimately affect their success in achieving the MDGs.

### **Trade expansion and development**

How does trade expansion affect human development and poverty? In theory, trade expansion should contribute directly to poverty reduction by increasing

the returns on the most abundant factor of production, which in developing economies tends to be low-skilled labor. But empirical studies disagree on the causal relationship between trade expansion and poverty reduction. Some studies find an increase in inequality after trade liberalization (World Bank and others 2005; UNDP 2005; Kremer and Maskin 2006). Others find that trade has a beneficial effect on poverty reduction—but may not be the most important factor (Billmeier and Nannicini 2007).

Despite the lack of agreement on the effects of trade expansion on poverty, economic theory and empirical evidence offer no reason to restrict trade. An increase in trade, especially exports, is associated with economic growth (figure 6a). This simple association between GDP growth and export growth overlooks differences between countries and other factors that affect economic growth. For example, small island economies may have to be more open in order to generate economic growth, while economies with sufficient domestic markets may require less export expansion to achieve economic growth. Analysis in *World Development Indicators 2007* showed that for countries starting from similar positions, countries that opened their economy (as measured by the ratio of imports and exports of goods and services to GDP) less rapidly recorded much lower per capita GDP growth.

In recent years many economies, especially in East Asia, experienced rapid growth in GDP and exports. But did export expansion trigger this economic growth or are increasing exports an outcome of growth? Although economists do not agree on causality, most empirical evidence indicates that greater openness to trade is an important element explaining growth performance—and has been a central feature

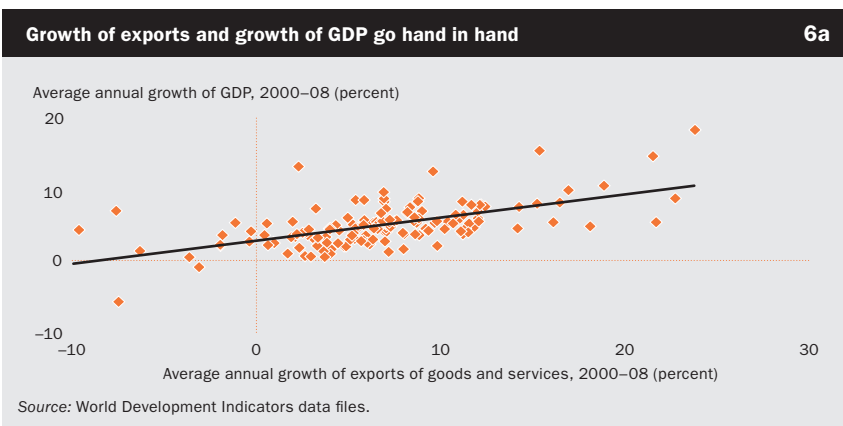

of successful economic development (OECD 2009b; Commission on Growth and Development 2008).

Economies benefit from increased international trade because it allows them to produce commodities for which they have a comparative advantage, sell those goods in a larger world market, and import goods and services that are more costly to produce domestically. Export expansion increases output, generates jobs, and raises household income, which may in turn improve health and other living conditions. Trade expansion can also raise education standards by giving people greater incentives to improve their skills. Foreign direct investors that are initially attracted by developing economies' cheap and abundant labor supply may also introduce new technology and know-how, and foreign competition may spur productivity and efficiency gains. Exports generate the foreign exchange needed to finance critical imports and may increase government revenue through taxes that can be used to finance social protection programs. Economies with small domestic markets likely have lower welfare and growth rates if they isolate themselves from the international movement of goods, factors, people, and ideas.

But trade liberalization brings additional challenges for developing economies in managing their external accounts. Economies that import more than they export are vulnerable to trade imbalance. Eighty of 111 developing economies for which data are available had a negative trade balance in 2008. For 67 of them the trade balance to GDP ratio has deteriorated since 1990. The ratio has worsened by more than 5 percentage points for 44 economies and by more than 10 percentage points for 26 economies. Dependence on imports may put poor countries at risk for currency crises, especially if they have limited access to foreign capital. Many developing economies are sensitive to opening their economies to trade because they worry that liberalization might merely increase cheap imports and harm local businesses instead of creating new export enterprises.

### Developing economies have increased their share of world trade

Developing economies have become more open, as measured by the ratio of trade (imports plus exports) to GDP, which rose from 34 percent in 1990 to 62 percent in 2008. Export revenues, constituting 30 percent of

developing economies' outputs in 2008 (up from 18 percent in 1990), are especially important for low-income economies (figure 6b). Developing economies increased their share of world trade from 16 percent of merchandise exports in 1990 to 33 percent in 2008 and from 12 percent of services exports in 1990 to 21 percent in 2008 (figure 6c). But the benefits were not shared equally. Low-income economies accounted for only 1 percent of world merchandise exports and less than 1 percent of world service exports in 2008.

### Low-income exporters specialize in labor-intensive goods

Export-led growth can improve human development outcomes and reduce poverty if it fosters employment in labor-intensive sectors where the poor have a stake. As the share of agriculture and labor-intensive manufacturing—such as textiles, clothing, and footwear—in world exports has fallen, both developing and high-income economies have adjusted by moving to capital-intensive manufacturing. But low-income economies, following their comparative advantage, still specialize in labor-intensive exports (figure 6d), which face higher tariffs than do other products (figure 6e).

Transitioning from labor-intensive exports to capital-intensive exports may be difficult. Ideally, increased trade should mean more jobs, lower unemployment, and higher wages. But trade liberalization has often failed to improve employment because new export industries have been capital-intensive manufactures, unable to create sufficient employment to absorb all of the workers transitioning from the agriculture sector.

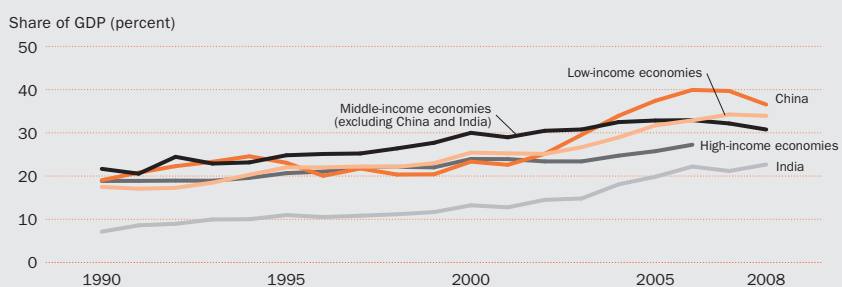

The poorest of the world's population live in rural areas and work in agriculture or fisheries. Boosting agricultural exports could increase agricultural employment and wages, thereby reducing poverty.

Most world trade in agriculture occurs between high-income economies, with low-income economies providing only about 2 percent of global agricultural exports (figure 6f). Developing economies have limited representation in global agricultural markets partly because their exports face higher tariffs from both high-income and developing economy partners. High-income economies also provide subsidies to their farmers, enabling them to sell agricultural products at very low prices that developing

economies cannot match. Under the MDG framework, OECD members promised to lower subsidies to agricultural producers, exporters, and consumers. Total agricultural supports as a share of GDP have fallen for most OECD members, but in nominal dollar terms support actually increased 3.2 percent between 2007 and 2008, to \$376 billion.

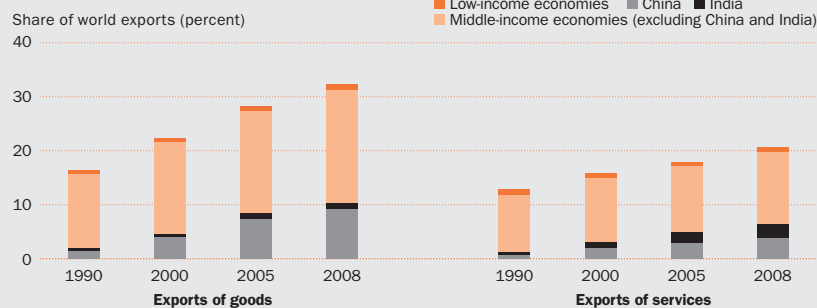

In the last decade some developing economies, especially the least developed countries, became net food importers. In the mid-1970s

18 of 28 least developed countries were net food exporters; by the mid-1990s 7 of them had become net food importers; and by the mid-2000s 10 of them had become net food importers. Vulnerable to increasing food prices, net food importers can suffer food insecurity and malnutrition.

### Trade diversification has improved—but unevenly

Trade diversification—in both partners and products—affects developing economies' ability to cope with external shocks such as commodity price changes and demand fluctuations.

Compared with two decades ago, developing economies are trading more with other developing economies, especially with economies in the same region (figure 6g). Developing economies' exports to other developing economies increased from 16 percent of merchandise exports in 1990 to 31 percent in 2008. Expansion of East Asia and Pacific and Sub-Saharan African economies' trade with other developing economies has been remarkable. East Asia and Pacific's exports to other developing economies rose from 13 percent of the region's total merchandise exports in 1990 to 29 percent in 2008. Sub-Saharan Africa's exports to other developing economies rose from 12 percent in 1990 to 37 percent in 2008. Still, more than 60 percent of developing economies' merchandise exports in 2008 were directed to high-income economies. The economic crisis that began in 2008 lowered developed economies' demand for imports, hurting the export revenues of developing economies that depended on high-income markets. Some economies, especially the poorest, depend on just a few partner economies. For example, more than 95 percent of the merchandise exports from Chad, Guinea-Bissau, and Niger in 2008 were directed to their five largest trading partners.

Many developing economies have improved their product diversification, but some remain dependent on only a few products. The top-five export commodities (which differ by country) made up around 75 percent of Sub-Saharan African economies' merchandise exports. And for some developing economies the top-five share exceeds 90 percent of total merchandise exports (figure 6h). On average, the share of the top-five export commodities in total exports tends to be higher for low-income economies

(71 percent) than for middle-income (59 percent) and high-income (50 percent) economies.

### Developed economies have lowered trade barriers, but not enough

Trade barriers encompass tariffs, quotas, anti-dumping duties, export subsidies, monopolistic measures, and technical regulations. Measuring overall trade restrictiveness involves aggregating these different forms of trade barriers across goods with different economic importance. The World Bank's Tariff Trade Restrictiveness Index (TTRI) and Overall Trade Restrictiveness Index (OTRI) measure the impact of a country's trade policy on its imports. The TTRI is the estimated uniform tariff equivalent to the effectively applied tariffs currently imposed on various import products. The OTRI is the uniform tariff equivalent to current tariff and non-tariff barriers to imports. A comparison of the TTRI and the OTRI implies that nontariff barriers are much higher than tariffs (figure 6i). On average, low-income economies impose higher tariffs and nontariff barriers than do other income groups to protect domestic production and raise revenue through taxes on imports. Although the average tariff and nontariff barriers imposed by high-income economies are low, their restrictions on agricultural products tend to be high. Because most of the world's poor earn their living through agriculture and other labor-intensive activities, substantial trade restrictions on these commodities block market access by the poor. Because high-income economies have the largest consumer markets, their trade policies have the most impact on developing economies' exports.

Exports from most economies face tariff and nontariff barriers in other economies. But low-income economies tend to face higher overall restrictions, especially for agricultural products (figure 6j). Market access by developing economies may also be affected by strict rules of origin that restrict preferential treatment of commodities not wholly produced in the exporting country.

As tariffs are the most widely known trade barrier, the MDG framework monitors the average tariffs imposed by OECD members on imports from developing economies. When examined in isolation, this indicator appears to show that developed economies have significantly lowered tariff barriers. But the actual situation is more complex. Averaging tariff rates

### For some developing economies only five products make up more than 90 percent of total merchandise exports

6j

Source: World Bank and IMF 2009b.

across thousands of products can mask high tariffs on certain commodities that are particularly important to developing economies. For some OECD members the maximum applied tariff rate can be as high as 887 percent (table 6k).

Among the most commonly used nontariff barriers are antidumping actions. Many high-income economies—and recently developing economies as well—initiate antidumping investigations. Whether for shiitake mushrooms entering Japan, steel entering the United

States, or shoes entering the European Union, antidumping initiations have a chilling effect on imports—even when they do not result in imposition of antidumping duties. Only about half of antidumping initiations are later imposed.

### Trade in services has grown rapidly, but total value remains small

Growth in developing economies' trade in services averaged 21 percent a year between 2005 and 2008, surpassing their previous performances and those of high-income economies (figure 6l). Europe and Central Asia experienced the highest growth, while Sub-Saharan Africa lagged behind. But trade in services still made up less than 20 percent of world trade in 2008.

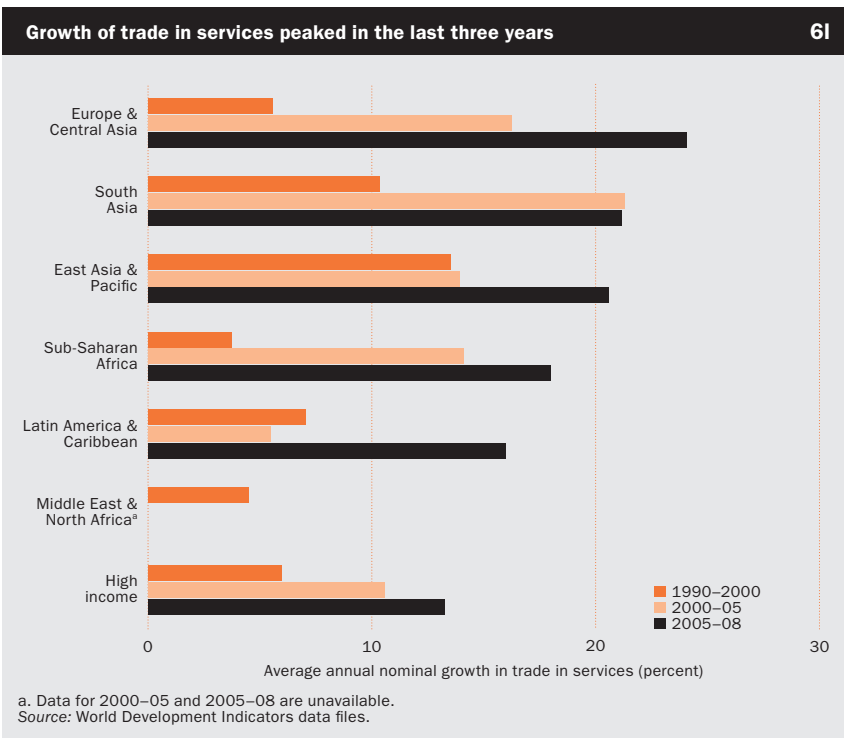

The World Trade Organization recognizes four modes of trade in services: cross-border exchange of services (such as the purchase of services from a foreign supplier and outsourcing), consumption abroad (such as tourism, education, and health services), commercial presence of foreign companies in a country (involving foreign direct investments), and movement of people. Trade in services usually faces tighter regulation and higher barriers than trade in merchandise.

Large middle-income economies recently increased their market shares in the outsourcing of services. For example, China is a key product development center for General Electric, Intel, Microsoft, Philips, and other large electronic firms focused on hardware and software design. India is the largest offshore provider of information technology services, technical help desks, and web support. But few developing economies have benefited from the recent expansion of outsourcing. Poorer countries tend to lack the necessary infrastructure—such as robust telecommunication networks and a reliable power supply—and skilled and educated workers. Outsourcing companies also require strong legal systems that ensure data security and privacy, which many developing economies lack.

Tourism is one of the largest segments of trade in services, generating employment, providing valuable foreign currency exchange, and increasing government revenues through taxation. The tourism industry employs people with various skill sets, including cleaners, drivers, beauticians, managers, and chefs. Developing economies' receipts from tourism

Some OECD members apply very high tariffs selectively (percent)					6k
	Year	Simple average tariff rate	Weighted average tariff rate	Maximum tariff rate	Share of tariff lines with rate of 15 percent or more
Australia	2008	4	2	18	5

have increased considerably, from \$92 billion (19 percent of the world total) in 1995 to \$324 billion (28 percent) in 2008 (figure 6m). East Asia and Pacific and Europe and Central Asia are the biggest beneficiaries. Residents of developing economies are also increasing their spending on tourism to other countries.

Human migration brings many benefits, such as remittances, improved skills and experience, and the transfer of technology during return migration. Workers' remittances—including employee compensation and migrant transfers—have become a large source of foreign exchange for many developing economies, increasing consumption and investment as well as the income of recipient families (figure 6n). For low-income economies with a negative trade balance, remittances provide an important source of external financing. Yet migration may have negative effects, siphoning off skilled workers and increasing inequality between remittance recipients and other families. Some economies have increased restrictions on labor services, including restrictions on the temporary cross-border movement of construction workers.

### Trade facilitation is improving slowly—but lower income economies lag behind

Trade facilitation may boost trade as effectively as tariff reduction (Hertel, Walmsley, and Itakura 2001; Wilson, Mann, and Otsuki 2004). The MDG framework recognizes the importance of trade facilitation by including an indicator to monitor aid for building trade capacity.

Aid for trade aims to help developing economies—especially low-income ones—overcome structural and capacity limitations that undermine their ability to produce, compete, and fully benefit from global integration. One of many ways aid for trade can help developing economies is by identifying infrastructure bottlenecks, improving logistics efficiency, and smoothing the supply chain. But how should the impact of aid for trade on the performance of developing economies be measured? Outcome indicators such as value and growth of exports and imports are important; so are indicators that measure trade logistics performance and trade-related infrastructure. Better logistics performance is associated with trade expansion, export diversification, and the ability to attract foreign direct investment.

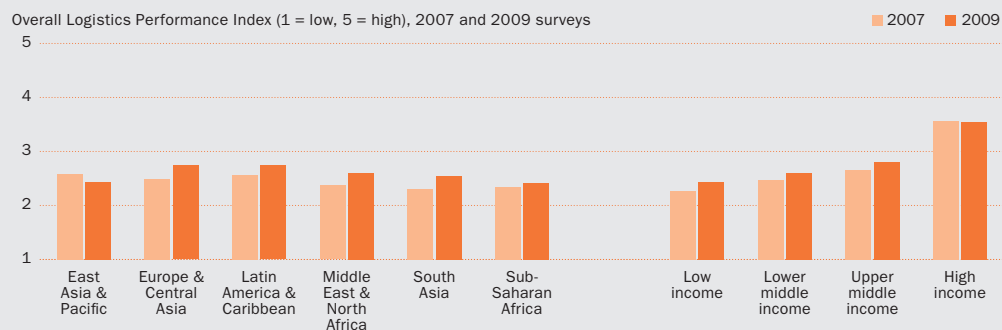

## Logistics performance is lowest for low-income economies

60

Source: Arvis and others 2007 and 2010.

Until recently, data on trade facilitation and logistics performance have been scarce. But in 2007 and 2009 the World Bank surveyed logistics professionals and created a Logistics Performance Index that summarizes a country's performance in six areas of trade logistics: efficiency of customs clearance processes, quality of trade- and transport-related infrastructure, ease of arranging competitively priced shipments, competence and quality of logistics services, ability to track and trace consignments, and frequency with which shipments reach the consignee within the scheduled or expected time. The surveys suggest that transportation costs, the time to import and export, and customs efficiency are all key but that the most important determinant of export competitiveness and volume is the overall reliability and predictability of the supply chain (Arvis and others 2007, 2010). In essence, traders need to be able to move goods and services across borders quickly and cheaply. And in economies with poor logistics performance, importers and exporters incur additional expenses to mitigate the effects of unreliable supply chains.

High-income economies dominate the top ratings for logistics performance, while the 10 lowest performing economies are all low- and lower middle-income economies, mostly in Africa. Between 2006 and 2009 the overall logistics performance of economies improved, but low-income economies tend to perform worse than middle- and high-income economies (figure 6o).

### Higher transport costs impede trade in developing economies

The costs of international transport services are a crucial determinant of developing economies'

export competitiveness. For example, a 2001 study found that a 1 percent reduction in the cost of maritime and air transport services could increase Asian GDP by \$3.3 billion (UNCTAD 2001). Transport costs are asymmetric worldwide and are especially high for landlocked developing economies. In Central Asia the cost of transporting a 40 ton container by road between Central Asia and Europe varies depending on the direction traveled: moving goods west to east costs \$6,000 but moving them east to west costs only \$4,000 (Arvis, Raballand, and Marteau 2007).

Comprehensive data on transport costs for all developing economies are not available. One proxy indicator for transport costs is the shipping rates of companies that operate globally in the international freight moving business. For example, the median DHL rate for sending a 1 kilogram package to the United States was 1.6 times higher from low-income economies than from high-income economies.

Transport costs depend on a mixture of geographic and economic circumstances. Freight costs tend to be higher for low-income economies. Landlocked countries or countries without access to large economic centers face much higher transportation costs than do coastal countries and countries located near business centers (box 6p). These economies tend to have poor infrastructure and thin traffic densities, further impeding their export competitiveness.

### Improving trade infrastructure to facilitate trade

Infrastructure, especially transport services infrastructure, is vital for trade facilitation. Port quality and accessibility, road quality,

and access to global shipping and air freight networks influence the overall logistics performance of international traders. For example, a 2006 study concluded that investment in upgrading and maintaining a trans-African highway network linking 83 major African cities could increase intra-African trade from \$10 billion a year to \$30 billion (Buys, Deichmann, and Wheeler 2006). Similarly, improving road networks in 27 European and Central Asian economies could increase their trade by as much as 50 percent (Shepherd and Wilson 2007).

Infrastructure quality may be just as important as its availability. According to a survey of logistics professionals, poor infrastructure quality is a widespread constraint on the logistics performance of developing economies. Moreover, satisfaction with infrastructure quality was much higher for economies ranked highest in overall logistics performance (Arvis and others 2010). Port infrastructure is important for economies that rely heavily on sea transport. According to a survey of business executives, 62 of 69 economies ranked below average in port quality were developing economies, 22 of them low-income (World Economic Forum 2009).

### Time delays add to trading costs

Traders also face indirect transport costs: the time required to import and export goods, border inefficiency, and the risk of freight loss or damage. Indirect costs can be higher than direct costs. For example, World Bank research suggests that one additional day of shipping delays cuts trade by at least 1 percent (Djankov, Freund, and Pham 2010). In Europe and Central Asia and Sub-Saharan Africa tariff equivalents of time to export were more than twice the average applied tariff (USAID 2007). According to the 2009 Logistics Performance

#### Challenges for landlocked economies

6p

Millennium Development Goal 8 focuses on landlocked countries. Like other small, low-income economies, landlocked developing economies have unpredictable supply chains, reflecting uncertainty in shipment delivery time, low demand levels, greater inventory costs, and low private sector capacities. Rent-seeking activities are higher when shipments transit through other economies and international corridors, contributing to higher trading costs (Arvis, Raballand, and Marteau 2007). On average, landlocked economies trade 30 percent less than coastal economies (Limao and Venables 2001).

Access to global shipping and freight networks is an important determinant of a country's export competitiveness. Because landlocked economies lack direct access to liner shipping networks, access to air cargo networks is especially important to them. Though faster and more reliable than road transport, air freight typically costs 4–5 times more than road transport and 12–16 times more than sea transport (World Bank 2009a). Consequently, demand for air freight is limited in landlocked developing economies that ship small volumes of low-value-per-unit goods. Establishing and improving the efficiency of international trade corridors could significantly benefit landlocked economies.

Source: World Bank staff.

#### Lead time to import and export is longest for low-income economies

6q

Source: Arvis and others 2010.

Survey, for 50 percent of shipments, import and export lead times are three times longer for low-income economies than for high-income economies (figure 6q). And lead time to export from or import to Sub-Saharan African economies averages 7–8 days—much longer than for other developing regions such as Europe and Central Asia and South Asia.

a. Data are from the International Telecommunication Union's (ITU) World Telecommunication Development Report database. Please cite the ITU for third-party use of these data. b. World Bank estimates. c. Includes Taiwan, China. d. Includes Montenegro. e. World totals computed by the United Nations sum to zero, but because the aggregates shown here refer to World Bank definitions, regional and income group totals do not equal zero.

## About the data

Globalization—the integration of the world economy—has been a persistent theme of the past 25 years. Growth of cross-border economic activity has changed countries' economic structure and political and social organization. Not all effects of globalization can be measured directly. But the scope and pace of change can be monitored along four key dimensions: trade in goods and services, financial flows, movement of people, and communication.

Trade data are based on gross flows that capture the two-way flow of goods and services. In conventional balance of payments accounting, exports are recorded as a credit and imports as a debit. See tables 4.4 and 4.5 for data on the main trade components of merchandise trade and tables 4.6 and 4.7 for the same data on services trade.

Financing through international capital markets includes gross bond issuance, bank lending, and new equity placement as reported by Dealogic, a company specializing in the investment banking industry. In financial accounting inward investment is a credit and outward investment a debit. Gross flow is a better measure of integration than net flow because gross flow shows the total value of financial transactions over a period, while net flow is the sum of credits and debits and represents a balance in which many transactions are canceled out. Components of financing through international capital markets are reported in U.S. dollars by market sources.

Foreign direct investment (FDI) includes equity investment, reinvested earnings, and short- and long-term loans between parent firms and foreign affiliates. Distinguished from other kinds of international

investment, FDI establishes a lasting interest in or effective management control over an enterprise in another country. FDI may be understated in developing countries because some fail to report reinvested earnings and because the definition of long-term loans differs by country. However, data quality and coverage are improving as a result of continuous efforts by international and national statistics agencies (see *About the data* for table 6.12).

Workers' remittances are current private transfers from migrant workers resident in the host country for more than a year, irrespective of their immigration status, to recipients in their country of origin. Compensation of employees is the income of migrants resident in the host country for less than a year. Migration has increased in importance, accounting for a substantial part of global integration. The estimates of the international migrant stock are derived from data on people who reside in one country but were born in another, mainly from population censuses (see *About the data* and *Definitions* for table 6.18). One negative effect of migration is "brain drain"—emigration of highly educated people. The table shows data on emigration of people with tertiary education, drawn from Docquier, Marfouk, and Lowell (2007), who analyzed skilled migration using data from censuses and registers of Organisation for Economic Development and Co-operation (OECD) countries and provide data disaggregated by gender for 1990 and 2000.

Well developed communications infrastructure attracts investments and allows investors to capitalize on benefits of the digital age. See *About the data* for tables 5.11 and 5.12 for more information.

## Definitions

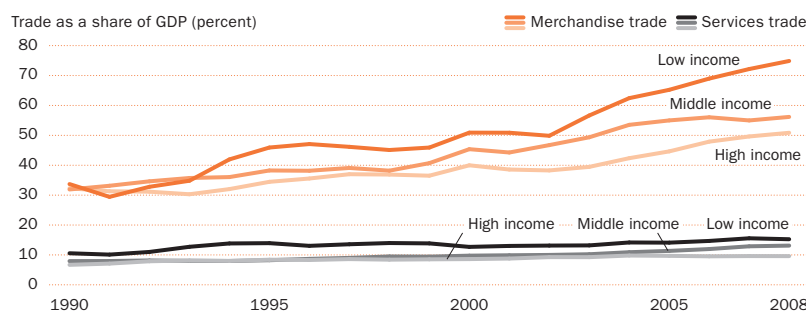

- **Trade in merchandise** is the sum of merchandise exports and imports.
- **Trade in services** is the sum of services exports and imports.
- **Financing through international capital markets** is the sum of the absolute values of new bond issuance, syndicated bank lending, and new equity placements.
- **Foreign direct investment net inflows and outflows** are net inflows and outflows of FDI (equity capital, reinvestment of earnings, and other short- and long-term capital).
- **Workers' remittances and compensation of employees received** are current transfers by migrant workers and wages and salaries of nonresident workers.
- **Net migration** is the number of immigrants minus the number of emigrants, including citizens and noncitizens, for the five-year period.
- **International migrant stock** is the number of people born in a country other than that in which they live, including refugees.
- **Emigration of people with tertiary education to OECD countries** is adults ages 25 and older, residing in an OECD country other than that in which they were born, with at least one year of tertiary education.
- **International voice traffic** is the sum of international incoming and outgoing telephone traffic divided by total population.
- **International Internet bandwidth** is the contracted capacity of international connections between countries for transmitting Internet traffic.

## Data sources

Data on merchandise trade are from the World Trade Organization's *Annual Report*. Data on trade in services are from the International Monetary Fund's (IMF) Balance of Payments database. Data on international capital market financing are based on data from Dealogic. Data on FDI are based on balance of payments data from the IMF, supplemented by staff estimates using data from the United Nations Conference on Trade and Development and official national sources. Data on workers' remittances are World Bank staff estimates based on IMF balance of payments data. Data on net migration are from the United Nations Population Division's *World Population Prospects: The 2008 Revision*. Data on international migrant stock are from the United Nations Population Division's *Trends in Total Migrant Stock: The 2008 Revision*. Data on emigration of people with tertiary education are from Docquier, Marfouk, and Lowell's "A Gendered Assessment of the Brain Drain" (2007). Data on international voice traffic and international Internet bandwidth are from the International Telecommunication Union's International Development Report database.

## Services trade has not grown as rapidly as merchandise trade

6.1a

Merchandise trade in low-income economies grew from 34 percent of GDP in 1990 to 75 percent in 2008 and in middle-income economies from 32 percent to 56 percent. The shares of services trade in GDP also rose but not as much.

a. Data are from the International Monetary Fund's International Financial Statistics database.

**About the data**

Data on international trade in goods are available from each country's balance of payments and customs records. While the balance of payments focuses on the financial transactions that accompany trade, customs data record the direction of trade and the physical quantities and value of goods entering or leaving the customs area. Customs data may differ from data recorded in the balance of payments because of differences in valuation and time of recording. The 1993 United Nations System of National Accounts and the fifth edition of the International Monetary Fund's (IMF) *Balance of Payments Manual* (1993) attempted to reconcile definitions and reporting standards for international trade statistics, but differences in sources, timing, and national practices limit comparability. Real growth rates derived from trade volume indexes and terms of trade based on unit price indexes may therefore differ from those derived from national accounts aggregates.

Trade in goods, or merchandise trade, includes all goods that add to or subtract from an economy's material resources. Trade data are collected on the basis of a country's customs area, which in most cases is the same as its geographic area. Goods provided as part of foreign aid are included, but goods destined for extraterritorial agencies (such as embassies) are not.

Collecting and tabulating trade statistics are difficult. Some developing countries lack the capacity to report timely data, especially landlocked countries and countries whose territorial boundaries are porous. Their trade has to be estimated from the data reported by their partners. (For further discussion of the use of partner country reports, see *About the data* for table 6.3.) Countries that belong to common customs unions may need to collect data through direct inquiry of companies. Economic or political concerns may lead some national authorities to suppress or misrepresent data on certain trade flows, such as oil, military equipment, or the exports of a dominant producer. In other cases reported trade data may be distorted by deliberate under- or over-invoicing to affect capital transfers or avoid taxes. And in some regions smuggling and black market trading result in unreported trade flows.

By international agreement customs data are reported to the United Nations Statistics Division, which maintains the Commodity Trade (Comtrade) and Monthly Bulletin of Statistics databases. The United Nations Conference on Trade and Development (UNCTAD) compiles international trade statistics, including price, value, and volume indexes,

from national and international sources such as the IMF's International Financial Statistics database, the United Nations Economic Commission for Latin America and the Caribbean, the United Nations Statistics Division's Monthly Bulletin of Statistics database, the World Bank Africa Database, the U.S. Bureau of Labor Statistics, Japan Customs, and UNCTAD's Commodity Price Statistics. The IMF also compiles data on trade prices and volumes in its International Financial Statistics (IFS) database.

Unless otherwise noted, the growth rates and terms of trade in the table were calculated from index numbers compiled by UNCTAD. The growth rates and terms of trade for selected economies were calculated from index numbers compiled in the IMF's *International Financial Statistics*. In some cases price and volume indexes from different sources vary significantly as a result of differences in estimation procedures. Because the IMF does not publish trade value indexes, for selected economies the trade value indexes were derived from the volume and price indexes. All indexes are rescaled to a 2000 base year.

The terms of trade measures the relative prices of a country's exports and imports. There are several ways to calculate it. The most common is the net barter (or commodity) terms of trade index, or the ratio of the export price index to the import price index. When a country's net barter terms of trade index increases, its exports become more valuable or its imports cheaper.

**Definitions**

- **Export and import volumes** are indexes of the quantity of goods traded. They are derived from UNCTAD's volume index series and are the ratio of the export or import value indexes to the corresponding unit value indexes. Unit value indexes are based on data reported by countries that demonstrate consistency under UNCTAD quality controls, supplemented by UNCTAD's estimates using the previous year's trade values at the Standard International Trade Classification three-digit level as weights. For economies for which UNCTAD does not publish data, the export and import volume indexes (lines 72 and 73) in the IMF's *International Financial Statistics* are used to calculate the average annual growth rates.

- **Export and import values** are the current value of exports (free on board, f.o.b.) or imports (cost, insurance, and freight, c.i.f.), converted to U.S. dollars and expressed as a percentage of the average for the base period (2000). UNCTAD's export or import value indexes are reported for most economies. For selected economies for which UNCTAD does not publish data, the value indexes are derived from export or import volume indexes (lines 72 and 73) and corresponding unit value indexes of exports or imports (lines 74 and 75) in the IMF's *International Financial Statistics*.
- **Net barter terms of trade index** is calculated as the percentage ratio of the export unit value indexes to the import unit value indexes, measured relative to the base year 2000.

**Data sources**

Data on trade indexes are from UNCTAD's annual *Handbook of Statistics* for most economies and from the IMF's *International Financial Statistics* for selected economies.

a. Data for 1998 are based on imports from South Africa reported by other economies because data on exports for South Africa were not available.

# 6.3

## Direction and growth of merchandise trade

### About the data

The table provides estimates of the flow of trade in goods between groups of economies. The data are from the International Monetary Fund's (IMF) Direction of Trade database. All high-income economies and major developing economies report trade on a timely basis, covering about 85 percent of trade for recent years. Trade by less timely reporters and by countries that do not report is estimated using reports of trading partner countries. Because the largest exporting and importing countries are reliable reporters, a large portion of the missing trade flows can be estimated from partner reports. Partner country data may introduce discrepancies due to smuggling, confidentiality, different exchange rates, overreporting of transit trade, inclusion or exclusion of freight rates, and different points of valuation and times of recording.

In addition, estimates of trade within the European Union (EU) have been significantly affected by changes in reporting methods following the creation of a customs union. The current system for collecting data on trade between EU members—Intrastat, introduced in 1993—has less exhaustive coverage than the previous customs-based system and has resulted in some problems of asymmetry (estimated imports are about 5 percent less than exports). Despite these issues, only a small portion of world trade is estimated to be omitted from the IMF's *Direction of Trade Statistics Yearbook* and Direction of Trade database.

Most countries report their trade data in national currencies, which are converted into U.S. dollars

using the IMF's published period average exchange rate (series rf or rh, monthly averages of the market or official rates) for the reporting country or, if unavailable, monthly average rates in New York. Because imports are reported at cost, insurance, and freight (c.i.f.) valuations, and exports at free on board (f.o.b.) valuations, the IMF adjusts country reports of import values by dividing them by 1.10 to estimate equivalent export values. The accuracy of this approximation depends on the set of partners and the items traded. Other factors affecting the accuracy of trade data include lags in reporting, recording differences across countries, and whether the country reports trade according to the general or special system of trade. (For further discussion of the measurement of exports and imports, see *About the data* for tables 4.4 and 4.5.)

The regional trade flows in the table are calculated from current price values. The growth rates are in nominal terms; that is, they include the effects of changes in both volumes and prices.

### Definitions

- **Merchandise trade** includes all trade in goods; trade in services is excluded.
- **High-income economies** are those classified as such by the World Bank (see inside front cover).
- **European Union** is defined as all high-income EU members: Austria, Belgium, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Luxembourg, Malta, the Netherlands, Portugal, Slovak Republic, Slovenia, Spain, Sweden, and the United Kingdom.
- **Other high-income economies** include all high-income economies (both Organisation for Economic Co-operation and Development members and others) except the high-income European Union, Japan, and the United States.
- **Low- and middle-income regional groupings** are based on World Bank classifications (see inside back cover for regional groupings) and may differ from those used by other organizations.

### Trade among developing economies has grown faster than trade among high-income economies

6.3a

Low- and middle-income economies increased their imports from other low- and middle-income economies. High-income economies are also increasingly importing from low- and middle-income economies.

Source: World Bank staff calculations based on data from the International Monetary Fund's Direction of Trade database.

### Data sources

Data on the direction and growth of merchandise trade were calculated using the IMF's Direction of Trade database.

## About the data

Developing economies are becoming increasingly important in the global trading system. Since the early 1990s trade between high-income economies and low- and middle-income economies has grown faster than trade among high-income economies. The increased trade benefits consumers and producers. But as was apparent at the World Trade Organization's (WTO) Ministerial Conferences in Doha, Qatar, in October 2001; Cancun, Mexico, in September 2003; and Hong Kong SAR, China, in December 2005, achieving a more pro-development outcome from trade remains a challenge. Doing so will require strengthening international consultation. After the Doha meetings negotiations were launched on services, agriculture, manufactures, WTO rules, the environment, dispute settlement, intellectual property rights protection, and disciplines on regional integration. At the most recent negotiations in Hong Kong SAR, China, trade ministers agreed to eliminate subsidies of agricultural exports by 2013; to abolish cotton export subsidies and grant unlimited export access to selected cotton-growing countries in Sub-Saharan Africa; to cut more domestic farm supports in the European Union, Japan, and the United States; and to offer more aid to developing countries to help them compete in global trade.

Trade flows between high-income and low- and middle-income economies reflect the changing mix of exports to and imports from developing economies. While food and primary commodities have continued to fall as a share of high-income economies' imports,

manufactures as a share of goods imports from both low- and middle-income economies have grown. And trade between developing economies has grown substantially over the past decade, a result of their increasing share of world output and liberalization of trade, among other influences.

Yet trade barriers remain high. The table includes information about tariff rates by selected product groups. Applied tariff rates are the tariffs in effect for partners in preferential trade agreements such as the North American Free Trade Agreement. When these rates are unavailable, most favored nation rates are used. The difference between most favored nation and applied rates can be substantial. Simple averages of applied rates are shown because they are generally a better indicator of tariff protection than weighted average rates are.

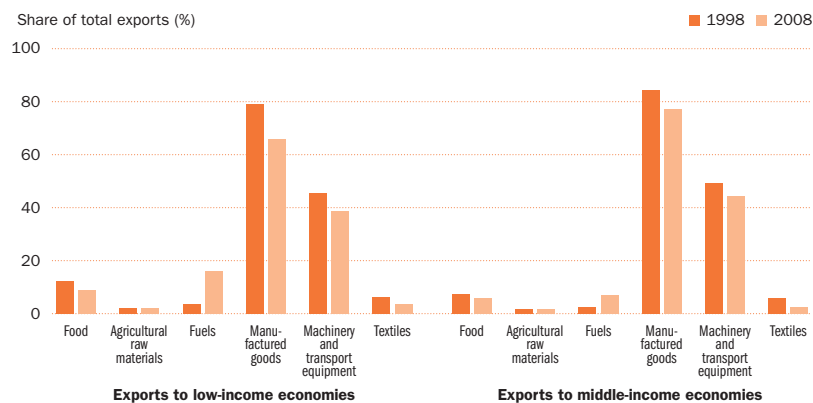

The data are from the United Nations Conference on Trade and Development (UNCTAD). Partner country reports by high-income economies were used for both exports and imports. Because of differences in sources of data, timing, and treatment of missing data, the numbers in the table may not be fully comparable with those used to calculate the direction of trade statistics in table 6.3 or the aggregate flows in tables 4.4, 4.5, and 6.2. Tariff line data were matched to Standard International Trade Classification (SITC) revision 3 codes to define commodity groups. For further discussion of merchandise trade statistics, see *About the data* for tables 4.4, 4.5, 6.2, 6.3, and 6.5, and for information about tariff barriers, see table 6.8.

## Definitions

The product groups in the table are defined in accordance with SITC revision 3: **food** (0, 1, 22, and 4) and **cereals** (04); **agricultural raw materials** (2 excluding 22, 27, and 28); **ores and nonferrous metals** (27, 28, and 68); **fuels** (3), **crude petroleum** (crude petroleum oils and oils obtained from bituminous minerals; 333), and **petroleum products** (noncrude petroleum and preparations; 334); **manufactured goods** (5–8 excluding 68), **chemical products** (5), **iron and steel** (67), **machinery and transport equipment** (7), **furniture** (82), **textiles** (65 and 84), **footwear** (85), and **other manufactured goods** (6 and 8 excluding 65, 67, 68, 82, 84, and 85); and **miscellaneous goods** (9). • **Exports** are all merchandise exports by high-income economies to low-income and middle-income economies as recorded in the United Nations Statistics Division's Comtrade database. Exports are recorded free on board (f.o.b.). • **Imports** are all merchandise imports by high-income economies from low-income and middle-income economies as recorded in the United Nations Statistics Division's Commodity Trade (Comtrade) database. Imports include insurance and freight charges (c.i.f.). • **High-, middle-, and low-income economies** are those classified as such by the World Bank (see inside front cover). • **European Union** is defined as all high-income EU members: Austria, Belgium, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Luxembourg, Malta, the Netherlands, Portugal, Slovak Republic, Slovenia, Spain, Sweden, and the United Kingdom.

## High-income economies export mostly manufactured goods to low- and middle-income economies

6.4a

Some 65–75 percent of high-income economy exports to low-income and middle-income economies in 2008 were manufactured goods. Machinery and equipment accounted for nearly 60 percent of manufactured goods exports from high-income economies.

Source: World Bank staff calculations based on data from the United Nations Statistics Division's Comtrade database.

## Data sources

Data on trade values are from United Nations Statistics Division's Comtrade database. Data on tariffs are from UNCTAD's Trade Analysis and Information System database and are calculated by World Bank staff using the World Integrated Trade Solution system.

**Note:** Bilateral trade data are not available for Timor-Leste, Kosovo, West Bank and Gaza, Botswana, Eritrea, Lesotho, Namibia, and Swaziland. Components may not sum to 100 percent because of trade with unspecified partners or with economies not covered by World Bank classification.

# 6.5

## Direction of trade of developing economies

### About the data

Developing economies are an increasingly important part of the global trading system. Their share of world merchandise exports rose from 15 percent in 1990 to 31 percent in 2008. And trade between high-income economies and low- and middle-income economies has grown faster than trade between high-income economies. This increased trade benefits both producers and consumers in developing and high-income economies.

The table shows trade in goods between developing economies in the same region and other regions and between developing economies and high-income economies. Data on exports and imports are from the International Monetary Fund's (IMF) Direction of Trade database and should be broadly consistent with data from other sources, such as the United Nations Statistics Division's Commodity Trade (Comtrade) database. Generally, data on trade between developing and high-income economies are complete. But trade flows between many developing economies—particularly those in Sub-Saharan Africa—are not well recorded, and the value of trade among developing economies may be understated. The table does not include some developing economies because data on their bilateral trade flows are not available. Data on the direction of trade between selected high-income economies are presented and discussed in tables 6.3 and 6.4.

At the regional level most exports from developing economies are to high-income economies, but the share of intraregional trade is increasing. Geographic patterns of trade vary widely by country

and commodity. Larger shares of exports from oil- and resource-rich economies are to high-income economies.

The relative importance of intraregional trade is higher for both landlocked countries and small countries with close trade links to the largest regional economy. For most developing economies—especially smaller ones—there is a “geographic bias” favoring intraregional trade. Despite the broad trend toward globalization and the reduction of trade barriers, the relative share of intraregional trade increased for most economies between 1998 and 2008. This is due partly to trade-related advantages, such as proximity, lower transport costs, increased knowledge from repeated interaction, and cultural and historical affinity. The direction of trade is also influenced by preferential trade agreements that a country has made with other economies. Though formal agreements on trade liberalization do not automatically increase trade, they nevertheless affect the direction of trade between the participating economies. Table 6.7 illustrates the size of existing regional trade blocs that have formal preferential trade agreements.

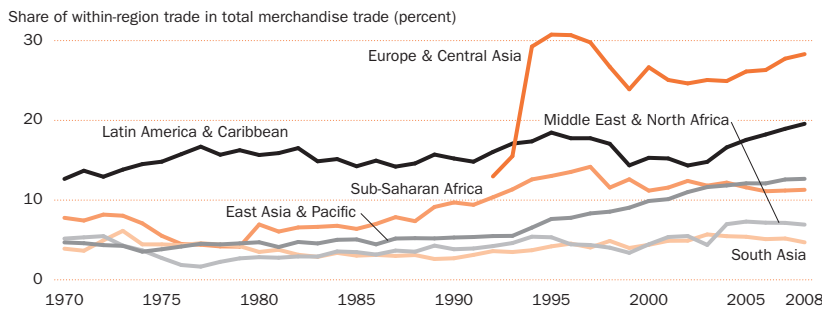

Although global integration has increased, developing economies still face trade barriers when accessing other markets (see table 6.8).

### Definitions

- **Exports to developing economies within region** are the sum of merchandise exports from the reporting economy to other developing economies in the same World Bank region as a percentage of total merchandise exports by the economy.
- **Exports to developing economies outside region** are the sum of merchandise exports from the reporting economy to other developing economies in other World Bank regions as a percentage of total merchandise exports by the economy.
- **Exports to high-income economies** are the sum of merchandise exports from the reporting economy to high-income economies as a percentage of total merchandise exports by the economy.
- **Imports from developing economies within region** are the sum of merchandise imports by the reporting economy from other developing economies in the same World Bank region as a percentage of total merchandise imports by the economy.
- **Imports from developing economies outside region** are the sum of merchandise imports by the reporting economy from other developing economies in other World Bank regions as a percentage of total merchandise imports by the economy.
- **Imports from high-income economies** are the sum of merchandise imports by the reporting economy from high-income economies as a percentage of total merchandise imports by the economy.

### Developing economies are increasingly trading with other developing economies in the same region

6.5a

Within-region trade (merchandise exports plus merchandise imports) has increased in all regions. In 2008 nearly 30 percent of merchandise trade in Europe and Central Asia and 20 percent in East Asia and Pacific was with other economies in the region.

Source: World Bank staff calculations based on data from International Monetary Fund's Direction of Trade database.

### Data sources

Data on merchandise trade flows are published in the IMF's *Direction of Trade Statistics Yearbook* and *Direction of Trade Statistics Quarterly*; the data in the table were calculated using the IMF's Direction of Trade database. Regional and income group classifications are according to the World Bank classification of economies as of July 1, 2009, and are as shown on the cover flaps.

Note: bbl = barrel, cu. m = cubic meter, dmtu = dry metric ton unit, kg = kilogram, mmBtu = million British thermal units, mt = metric ton, toz = troy ounce.

a. Series not included in the nonenergy index.

## About the data

Primary commodities—raw or partially processed materials that will be transformed into finished goods—are often developing countries' most important exports, and commodity revenues can affect living standards. Price data are collected from various sources, including international commodity study groups, government agencies, industry trade journals, and Bloomberg and Datastream. Prices are compiled in U.S. dollars or converted to U.S. dollars when quoted in local currencies.

The table is based on frequently updated price reports. Prices are those received by exporters when available, or the prices paid by importers or trade unit values. Annual price series are generally simple averages based on higher frequency data. The constant price series in the table are deflated by the manufactures unit value (MUV) index for the Group of Five (G-5) countries (see below).

Commodity price indexes are calculated as Laspeyres index numbers; the fixed weights are the 2002–04 average export values for low- and middle-income economies (based on 2001 gross national income) rebased to 2000. Data for exports are from the United Nations Statistics Division's Commodity Trade Statistics (Comtrade) database Standard International Trade Classification (SITC) revision 3, the Food Agriculture Organization's FAOSTAT database, the International Energy Agency database, BP's *Statistical Review of World Energy*, the World Bureau of Metal Statistics, World Bank staff estimates, and other sources.

Each index in the table represents a fixed basket of primary commodity exports over time. The nonenergy

commodity price index contains 41 price series for 34 nonenergy commodities.

Separate indexes are compiled for energy and steel products, which are not included in the nonenergy commodity price index.

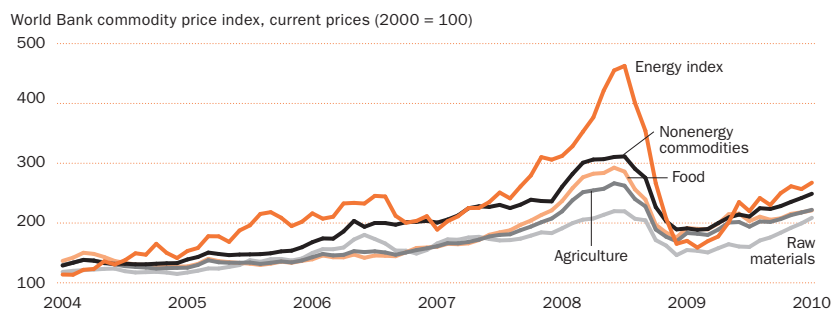

The MUV index is a composite index of prices for manufactured exports from the five major (G-5) industrial economies (France, Germany, Japan, the United Kingdom, and the United States) to low- and middle-income economies, valued in U.S. dollars. The index covers products in groups 5–8 of SITC revision 1. For the MUV G-5 index, unit value indexes in local currency for each country are converted to U.S. dollars using market exchange rates and are combined using weights determined by each country's export share in the base year (1995). The export shares were 8.2 percent for France, 17.4 percent for Germany, 35.6 percent for Japan, 6.6 percent for the United Kingdom, and 32.2 percent for the United States.

## Definitions

- **Energy price index** is the composite price index for coal, petroleum, and natural gas, weighted by exports of each commodity from low- and middle-income countries.
- **Nonenergy commodity price index** covers the 34 nonenergy primary commodities that make up the agriculture, fertilizer, and metals and minerals indexes.
- **Agriculture** includes beverages, food, and agricultural raw materials.
- **Beverages** include cocoa, coffee, and tea.
- **Food** includes fats and oils, grains, and other food items. Fats and oils include coconut oil, groundnut oil, palm oil, soybeans, soybean oil, and soybean meal. Grains include barley, maize, rice, and wheat. Other food items include bananas, beef, chicken meat, oranges, shrimp, and sugar.
- **Agricultural raw materials** include timber and other raw materials. Timber includes tropical hard logs and sawnwood. Other raw materials include cotton, natural rubber, and tobacco.
- **Fertilizers** include phosphate, phosphate rock, potassium, and nitrogenous products.
- **Metals and minerals** include aluminum, copper, iron ore, lead, nickel, tin, and zinc.
- **Steel products price index** is the composite price index for eight steel products based on quotations free on board (f.o.b.) Japan excluding shipments to the United States for all years and to China prior to 2001, weighted by product shares of apparent combined consumption (volume of deliveries) for Germany, Japan, and the United States.
- **Commodity prices**—for definitions and sources, see "Commodity price data" (also known as the "Pink Sheet") at the World Bank Prospects for Development website ([www.worldbank.org/prospects](http://www.worldbank.org/prospects), click on Products).
- **MUV G-5 index** is the manufactures unit value index for G-5 country exports to low- and middle-income economies.

## Primary commodity prices have been volatile over the past two years

6.6a

Commodity prices rose rapidly in early 2008 before collapsing in the second half of the year. But prices rose again in 2009. Between January 2009 and January 2010 the average price of energy commodities increased 57 percent and the average price of nonenergy commodities increased 30 percent.

Source: World Bank commodity price data.

## Data sources

Data on commodity prices and the MUV G-5 index are compiled by the World Bank's Development Prospects Group. Monthly updates of commodity prices are available at [www.worldbank.org/prospects](http://www.worldbank.org/prospects).

a. CU is customs union; EIA is economic integration agreement; FTA is free trade agreement; PTA is preferential trade agreement; and NNA is not notified agreement, which refers to preferential trade arrangements established among member countries that are not notified to the World Trade Organization (these agreements may be functionally equivalent to any of the other agreements). b. No preferential trade agreement c. Years of the most recent agreement are collected from the official website of the trade bloc.

## About the data

Trade blocs are groups of countries with preferential arrangements governing trade between members. Although the preferences—such as lower tariff duties or exemptions from quantitative restrictions—may be no greater than those available to other trading partners, such arrangements are intended to encourage exports by bloc members to one another—sometimes called intratrade.

Most countries are members of a regional trade bloc, and more than a third of world trade takes place within such arrangements. While trade blocs vary in structure, they have the same objective: to reduce trade barriers between members. But effective integration requires more than reducing tariffs and quotas. Economic gains from competition and scale may not be achieved unless other barriers that divide markets and impede the free flow of goods, services, and investments are lifted. For example, many regional trade blocs retain contingent protections on intratrade, including antidumping, countervailing duties, and “emergency protection” to address balance of payments problems or protect an industry from import surges. Other barriers include differing product standards, discrimination in public procurement, and cumbersome border formalities.

Trade bloc membership may reduce the frictional costs of trade, increase the credibility of reform initiatives, and strengthen security among partners. But making it work effectively is challenging. All economic sectors may be affected, and some may expand while others contract, so it is important to weigh the potential costs and benefits of membership.

The table shows the value of merchandise intratrade (service exports are excluded) for important regional trade blocs and the size of intratrade relative

to each bloc’s exports of goods and the share of the bloc’s exports in world exports. Although the Asia Pacific Economic Cooperation (APEC) has no preferential arrangements, it is included because of the volume of trade between its members.

The data on country exports are from the International Monetary Fund’s (IMF) Direction of Trade database and should be broadly consistent with those from sources such as the United Nations Statistics Division’s Commodity Trade (Comtrade) database. However, trade flows between many developing countries, particularly in Sub-Saharan Africa, are not well recorded, so the value of intratrade for certain groups may be understated. Data on trade between developing and high-income countries are generally complete.

Unless otherwise noted, the type of agreement and date of enforcement are based on the World Trade Organization’s (WTO) list of regional trade agreements. Other types of preferential trade agreements may have entered into force earlier than those shown in the table and may still be effective.

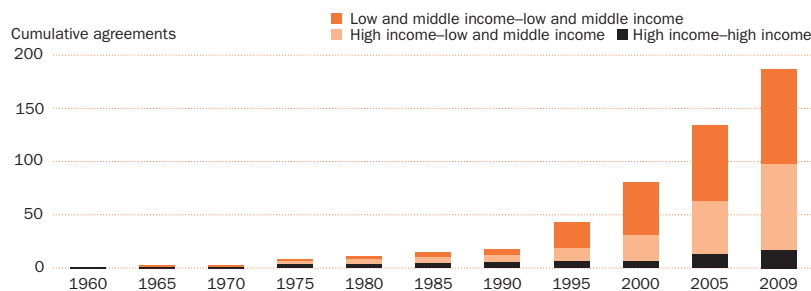

Although bloc exports have been calculated back to 1990 based on current membership, several blocs came into existence after that and membership may have changed over time. For this reason, and because systems of preferences also change over time, intratrade in earlier years may not have been affected by the same preferences as in recent years. In addition, some countries belong to more than one trade bloc, so shares of world exports exceed 100 percent. Exports include all commodity trade, which may include items not specified in trade bloc agreements. Differences from previously published estimates may be due to changes in membership or revisions in underlying data.

## Definitions

• **Merchandise exports within bloc** are the sum of merchandise exports by members of a trade bloc to other members of the bloc. They are shown both in U.S. dollars and as a percentage of total merchandise exports by the bloc. • **Merchandise exports by bloc** as a share of world exports are the bloc’s total merchandise exports (within the bloc and to the rest of the world) as a share of total merchandise exports by all economies in the world. • **Type of most recent agreement** includes customs union, under which members substantially eliminate all tariff and nontariff barriers among themselves and establish a common external tariff for nonmembers; economic integration agreement, which liberalizes trade in services among members and covers a substantial number of sectors, affects a sufficient volume of trade, includes substantial modes of supply, and is non-discriminatory (in the sense that similarly situated service suppliers are treated the same); free trade agreement, under which members substantially eliminate all tariff and nontariff barriers but set tariffs on imports from nonmembers; preferential trade agreement, which is an agreement notified to the WTO that is not a free trade agreement, a customs union, or an economic integration agreement; and not notified agreement, which is a preferential trade arrangement established among member countries that is not notified to the World Trade Organization (the agreement may be functionally equivalent to any of the other agreements).

**The number of trade agreements has increased rapidly since 1990, especially agreements between high-income economies and developing economies and agreements among developing economies**

6.7a

**Note:** Data are cumulative number of trade agreements notified to the General Agreement on Tariffs and Trade/World Trade Organization (GATT/WTO) at the time they entered into force. Includes only agreements that are currently in force. Excludes agreements on services and accessions of new members to an existing agreement.

**Source:** World Bank staff calculations based on the World Trade Organization’s Regional Trade Agreements Information System.

## Data sources

Data on merchandise trade flows are published in the IMF’s *Direction of Trade Statistics Yearbook* and *Direction of Trade Statistics Quarterly*; the data in the table were calculated using the IMF’s Direction of Trade database. Data on trade bloc membership are from the World Bank Policy Research Report *Trade Blocs* (2000b), UNCTAD’s *Trade and Development Report 2007*, WTO’s Regional Trade Agreements Information System, and the World Bank’s International Trade Unit.

### About the data

Poor people in developing countries work primarily in agriculture and labor-intensive manufactures, sectors that confront the greatest trade barriers. Removing barriers to merchandise trade could increase growth in these countries—even more if trade in services (retailing, business, financial, and telecommunications services) were also liberalized.

In general, tariffs in high-income countries on imports from developing countries, though low, are twice those collected from other high-income countries. But protection is also an issue for developing countries, which maintain high tariffs on agricultural commodities, labor-intensive manufactures, and other products and services. In some developing country regions new trade policies could make the difference between achieving important Millennium Development Goals—reducing poverty, lowering maternal and child mortality rates, improving educational attainment—and falling far short.

Countries use a combination of tariff and nontariff measures to regulate imports. The most common form of tariff is an ad valorem duty, based on the value of the import, but tariffs may also be levied on a specific, or per unit, basis or may combine ad valorem and specific rates. Tariffs may be used to raise fiscal revenues or to protect domestic industries from foreign competition—or both. Nontariff barriers, which limit the quantity of imports of a particular good, include quotas, prohibitions, licensing schemes, export restraint arrangements, and health and quarantine measures. Because of the difficulty of combining nontariff barriers into an aggregate indicator, they are not included in the table.

Unless specified as most favored nation rates, the tariff rates used in calculating the indicators in the table are effectively applied rates. Effectively applied rates are those in effect for partners in preferential trade arrangements such as the North American Free Trade Agreement. The difference between most favored nation and applied rates can be substantial. As more countries report their free trade agreements, suspensions of tariffs, or other special preferences, *World Development Indicators* will include their effectively applied rates. All estimates are calculated using the most recent information, which is not necessarily revised every year. As a result, data for the same year may differ from data in last year's edition.

Three measures of average tariffs are shown: simple bound rates and the simple and the weighted tariffs. Bound rates are based on all products in a country's tariff schedule, while the most favored

nation or applied rates are calculated using all traded items. Weighted mean tariffs are weighted by the value of the country's trade with each trading partner. Simple averages are often a better indicator of tariff protection than weighted averages, which are biased downward because higher tariffs discourage trade and reduce the weights applied to these tariffs. Bound rates result from trade negotiations incorporated into a country's schedule of concessions and are thus enforceable.

Some countries set fairly uniform tariff rates across all imports. Others are selective, setting high tariffs to protect favored domestic industries. The share of tariff lines with international peaks provides an indication of how selectively tariffs are applied. The effective rate of protection—the degree to which the value added in an industry is protected—may exceed the nominal rate if the tariff system systematically differentiates among imports of raw materials, intermediate products, and finished goods.

The share of tariff lines with specific rates shows the extent to which countries use tariffs based on physical quantities or other, non-ad valorem measures. Some countries such as Switzerland apply mainly specific duties. To the extent possible, these specific rates have been converted to their ad valorem equivalent rates and have been included in the calculation of simple and weighted tariffs.

Data are classified using the Harmonized System of trade at the six- or eight-digit level. Tariff line data were matched to Standard International Trade Classification (SITC) revision 3 codes to define commodity groups and import weights. Import weights were calculated using the United Nations Statistics Division's Commodity Trade (Comtrade) database. The table shows tariff rates for three commodity groups: all products, primary products, and manufactured products. Effectively applied tariff rates at the six- and eight-digit product level are averaged for products in each commodity group. When the effectively applied rate is unavailable, the most favored nation rate is used instead.

Data are shown only for the last year for which complete data are available and for all economies with populations of 1 million or more and for countries with populations of less than 1 million when available. EU member countries apply a common tariff schedule that is listed under European Union and are thus not listed separately.

### Definitions

- **Binding coverage** is the percentage of product lines with an agreed bound rate.
- **Simple mean bound rate** is the unweighted average of all the lines in the tariff schedule in which bound rates have been set.
- **Simple mean tariff** is the unweighted average of effectively applied rates or most favored nation rates for all products subject to tariffs calculated for all traded goods.
- **Weighted mean tariff** is the average of effectively applied rates or most favored nation rates weighted by the product import shares corresponding to each partner country.
- **Share of tariff lines with international peaks** is the share of lines in the tariff schedule with tariff rates that exceed 15 percent.
- **Share of tariff lines with specific rates** is the share of lines in the tariff schedule that are set on a per unit basis or that combine ad valorem and per unit rates.
- **Primary products** are commodities classified in SITC revision 3 sections 0–4 plus division 68 (nonferrous metals).
- **Manufactured products** are commodities classified in SITC revision 3 sections 5–8 excluding division 68.

### Data sources

All indicators in the table were calculated by World Bank staff using the World Integrated Trade Solution system. Data on tariffs were provided by the United Nations Conference on Trade and Development and the World Trade Organization. Data on global imports are from the United Nations Statistics Division's Comtrade database.

a. Average of the 2008 and 2009 survey ratings. b. Landlocked country. c. Includes Montenegro. d. Aggregates are computed according to the World Bank classification of economies as of July 1, 2009, and may differ from data published in the original source.

### About the data

Broadly defined, trade facilitation encompasses customs efficiency and other physical and regulatory environments where trade takes place, harmonization of standards and conformance to international regulations, and the logistics of moving goods and associated documentation through countries and ports. Though collection of trade facilitation data has improved over the last decade, data that allow meaningful evaluation, especially for developing economies, are lacking. Data on trade facilitation are drawn from research by private and international agencies. Most data are perception-based evaluations by business executives and professionals. Because of different backgrounds, values, and personalities, those surveyed may evaluate the same situation quite differently. Perception-based indicators are thus subject to bias and require caution when interpreting the results. Nevertheless, they convey much needed information on trade facilitation.

The table presents data from Logistics Performance Surveys conducted by the World Bank in partnership with academic and international institutions and private companies and individuals engaged in international logistics. The Logistics Performance Index assesses logistics performance across six aspects of the logistics environment (see *Definitions*), based on more than 5,000 country assessments by nearly 1,000 international freight forwarders. Respondents evaluate eight markets on six core dimensions on a scale from 1 (worst) to 5 (best). The markets are chosen based on the most important export and import markets of the respondent's country, random selection, and, for landlocked countries, neighboring countries that connect them with international markets. Scores for the six areas are averaged across all respondents and aggregated to a single score. Details of the survey methodology and index construction methodology are in Arvis and others (2010).

Data on the burden of customs procedures are from the World Economic Forum's Executive Opinion Survey. The 2009 round included more than 13,000 respondents from 133 countries. Sampling follows a dual stratification based on company size and the sector of activity. Data are collected online or through in-person interviews. Responses are aggregated using sector-weighted averaging. The data for the latest year are combined with the data for the previous year to create a two-year moving average. Respondents evaluated the efficiency of customs procedures in their country. The lowest value (1) rates the customs procedure as extremely inefficient, and the highest score (7) as extremely efficient.

The direct costs of cross-border trade include freight, customs, and storage fees. Indirect costs include the value of time to import or export and the risk of delay or loss of shipments. Long lead times and burdensome regulatory procedures may lower competitiveness. Data on lead time are from the LPI survey. Respondents provided separate values for the best case (10 percent of shipments) and the median case (50 percent of shipments). The data are exponentiated averages of the logarithm of single value responses and of midpoint values of range responses for the median case.

Data on the number of documents needed to export or import are from the World Bank's Doing Business surveys, which compile procedural requirements for exporting and importing a standardized cargo of goods by ocean transport from local freight forwarders, shipping lines, customs brokers, port officials, and banks. To make the data comparable across economies, several assumptions about the business and the traded goods are used (see [www.doingbusiness.org](http://www.doingbusiness.org)).

Access to global shipping and air freight networks and the quality and accessibility of ports and roads affect logistics performance. The table shows two indicators related to trade and transport service infrastructure: the Liner Shipping Connectivity Index and the quality of port infrastructure rating. The Liner Shipping Connectivity Index captures how well countries are connected to global shipping networks. It is computed by the United Nations Conference on Trade and Development (UNCTAD) based on five components of the maritime transport sector: number of ships, their container-carrying capacity, maximum vessel size, number of services, and number of companies that deploy container ships in a country's ports. For each component a country's value is divided by the maximum value of each component in 2004, the five components are averaged for each country, and the average is divided by the maximum average for 2004 and multiplied by 100. The index generates a value of 100 for the country with the highest average index in 2004.

The quality of port infrastructure measures business executives' perception of their country's port facilities. Values range from 1 (port infrastructure considered extremely underdeveloped) to 7 (port infrastructure considered efficient by international standards). Respondents in landlocked countries were asked: "How accessible are port facilities (1 = extremely inaccessible; 7 = extremely accessible.)"

The costs of transport services are a crucial determinant of export competitiveness. The proxy indicator in the table is the shipping rates to the United States of an international freight moving business.

### Definitions

- **Logistics Performance Index** reflects perceptions of a country's logistics based on efficiency of customs clearance process, quality of trade- and transport-related infrastructure, ease of arranging competitively priced shipments, quality of logistics services, ability to track and trace consignments, and frequency with which shipments reach the consignee within the scheduled time. The index ranges from 1 to 5, with a higher score representing better performance.

- **Burden of customs procedure** measures business executives' perceptions of their country's efficiency of customs procedures. Values range from 1 to 7, with a higher rating indicating greater efficiency.
- **Lead time to export** is the median time (the value for 50 percent of shipments) from shipment point to port of loading.

- **Lead time to import** is the median time (the value for 50 percent of shipments) from port of discharge to arrival at the consignee.

- **Documents to export and documents to import** are all documents required per shipment by government ministries, customs authorities, port and container terminals, health and technical control agencies, and banks to export or import goods. Documents renewed annually and not requiring renewal per shipment are excluded.

- **Liner Shipping Connectivity Index** indicates how well countries are connected to global shipping networks based on the status of their maritime transport sector. The highest value in 2004 is 100.

- **Quality of port infrastructure** measures business executives' perceptions of their country's port facilities. Values range from 1 to 7, with a higher rating indicating better development of port infrastructure.

- **Freight costs to the United States** is the DHL international U.S. inbound worldwide priority express rate for a 1 kilogram air package. Any surcharges are excluded.

### Data sources

Data on the Logistics Performance Index and lead time to export and import are from Arvis and others' *Connecting to Compete: Trade Logistics in the Global Economy 2010*. Data on the burden of customs procedure and quality of port infrastructure ratings are from the World Economic Forum's *Global Competitiveness Report 2009–2010*. Data on number of documents to export and import are from the World Bank's Doing Business project ([www.doingbusiness.org](http://www.doingbusiness.org)). Data on the Liner Shipping Connectivity Index are from UNCTAD's *Transport Newsletter*, No. 43 (2009). Freight costs to the United States are based on DHL's "DHL Express Standard Rate Guideline 2010" (2010).

6.10

a. Includes Montenegro. b. Data are likely to be revised after being reconciled with creditor data. Total external debt for 2008 was \$5.199 billion, according to debtor reports published in *Global Development Finance*.

## About the data

External indebtedness affects a country's creditworthiness and investor perceptions. Data on external debt are gathered through the World Bank's Debtor Reporting System. Indebtedness is calculated using loan-by-loan reports submitted by countries on long-term public and publicly guaranteed borrowing and information on short-term debt collected by the countries or from creditors through the reporting systems of the Bank for International Settlements. These data are supplemented by information from major multilateral banks and official lending agencies in major creditor countries and by estimates by World Bank and International Monetary Fund (IMF) staff. The table includes data on long-term private nonguaranteed debt reported to the World Bank or estimated by its staff.

Data coverage, quality, and timeliness vary by country. Coverage varies for debt instruments and borrowers. The widening spectrum of debt instruments and investors alongside the expansion of private nonguaranteed borrowing makes comprehensive coverage of external debt more complex. Reporting countries differ in their capacity to monitor debt, especially private nonguaranteed debt. Even data on public and publicly guaranteed debt are affected by coverage and reporting accuracy—because of monitoring capacity and sometimes because of unwillingness to provide information. A key part often underreported is military debt. Currently, 128 developing countries report to the Debtor Reporting System. Nonreporting countries might have outstanding debt with the World Bank, other international financial institutions, and private creditors.

Debt data, normally reported in the currency of repayment, are converted into U.S. dollars to produce summary tables. Stock figures (amount of debt outstanding) are converted using end-of-period exchange rates, as published in the IMF's *International Financial Statistics* (line ae). Flow figures are converted at annual average exchange rates (line rf). Projected debt service is converted using end-of-period exchange rates. Debt repayable in multiple currencies, goods, or services and debt with a provision for maintenance of the value of the currency of repayment are shown at book value.

Because flow data are converted at annual average exchange rates and stock data at end-of-period exchange rates, year-to-year changes in debt outstanding and disbursed are sometimes not equal to net flows (disbursements less principal repayments); similarly, changes in debt outstanding, including undisbursed debt, differ from commitments less repayments. Discrepancies are particularly notable when exchange rates have moved sharply during the year. Cancellations and reschedulings of other liabilities into long-term public debt also contribute to the differences.

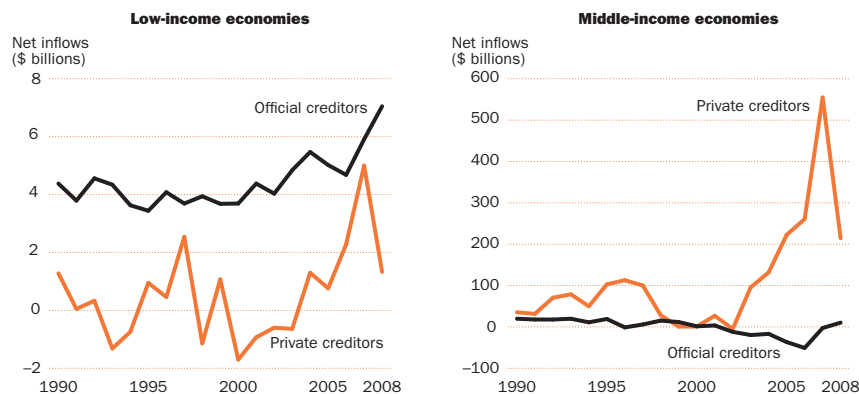

Variations in reporting rescheduled debt also affect cross-country comparability. For example, rescheduling of official Paris Club creditors may be subject to lags between completion of the general rescheduling agreement and completion of the specific bilateral agreements that define the terms of the rescheduled debt. Other areas of inconsistency include country treatment of arrears and of nonresident national deposits denominated in foreign currency.

## Definitions

- **Total external debt** is debt owed to nonresidents repayable in foreign currency, goods, or services. It is the sum of public, publicly guaranteed, and private nonguaranteed long-term debt, short-term debt, and use of IMF credit.
- **Long-term debt** is debt that has an original or extended maturity of more than one year. It has three components: public, publicly guaranteed, and private nonguaranteed debt.
- **Public and publicly guaranteed debt** comprises the long-term external obligations of public debtors, including the national government and political subdivisions (or an agency of either) and autonomous public bodies, and the external obligations of private debtors that are guaranteed for repayment by a public entity.
- **IBRD loans and IDA credits** are extended by the World Bank. The International Bank for Reconstruction and Development (IBRD) lends at market rates. The International Development Association (IDA) provides credits at concessional rates.
- **Private nonguaranteed debt** consists of the long-term external obligations of private debtors that are not guaranteed for repayment by a public entity.
- **Short-term debt** is debt owed to nonresidents having an original maturity of one year or less and interest in arrears on long-term debt.
- **Use of IMF credit** denotes members' drawings on the IMF other than those drawn against the country's reserve tranche position and includes purchases and drawings under Stand-By, Extended, Structural Adjustment, Enhanced Structural Adjustment, and Systemic Transformation Facility Arrangements, together with Trust Fund loans.

## Debt flows from private creditors to low- and middle-income economies fell sharply in 2008

6.10a

In 2008 debt flows from private creditors to low- and middle-income economies fell 61 percent, a decline only partially offset by an increase in net flows from official creditors.

Source: Global Development Finance data files.

## Data sources

Data on external debt are mainly from reports to the World Bank through its Debtor Reporting System from member countries that have received IBRD loans or IDA credits, with additional information from the files of the World Bank, the IMF, the African Development Bank and African Development Fund, the Asian Development Bank and Asian Development Fund, and the Inter-American Development Bank. Summary tables of the external debt of developing countries are published annually in the World Bank's *Global Development Finance*, on its *Global Development Finance* CD-ROM, and on *GDF Online*.

a. Includes workers' remittances. b. The numerator refers to 2008, whereas the denominator is a three year average of 2006–08 data. c. Data are from debt sustainability analyses for low-income countries. Present value estimates for these countries are for public and publicly guaranteed debt only. d. Includes Montenegro.

## About the data

A country's external debt burden, both debt outstanding and debt service, affects its creditworthiness and vulnerability. The table shows total external debt relative to a country's size—gross national income (GNI). Total debt service is contrasted with countries' ability to obtain foreign exchange through exports of goods, services, income, and workers' remittances.

Multilateral debt service (shown as a share of the country's total public and publicly guaranteed debt service) are obligations to international financial institutions, such as the World Bank, the International Monetary Fund (IMF), and regional development banks. Multilateral debt service takes priority over private and bilateral debt service, and borrowers must stay current with multilateral debts to remain creditworthy. While bilateral and private creditors often write off debts, international financial institution bylaws prohibit granting debt relief or canceling debts directly. However, the recent decrease in multilateral debt service ratios for some countries reflects debt relief from special programs, such as the Heavily Indebted Poor Countries (HIPC) Debt Initiative and the Multilateral Debt Relief Initiative (MDRI) (see table 1.4.) Other countries have accelerated repayment of debt outstanding. Indebted countries may also apply to the Paris and London Clubs to renegotiate obligations to public and private creditors.

Because short-term debt poses an immediate burden and is particularly important for monitoring vulnerability, it is compared with the total debt and foreign exchange reserves that are instrumental in

providing coverage for such obligations. The present value of external debt provides a measure of future debt service obligations.

The present value of external debt is calculated by discounting the debt service (interest plus amortization) due on long-term external debt over the life of existing loans. Short-term debt is included at face value. The data on debt are in U.S. dollars converted at official exchange rates (see *About the data* for table 6.10). The discount rate on long-term debt depends on the currency of repayment and is based on commercial interest reference rates established by the Organisation for Economic Co-operation and Development. Loans from the International Bank for Reconstruction and Development (IBRD), credits from the International Development Association (IDA), and obligations to the IMF are discounted using a special drawing rights reference rate. When the discount rate is greater than the loan interest rate, the present value is less than the nominal sum of future debt service obligations.

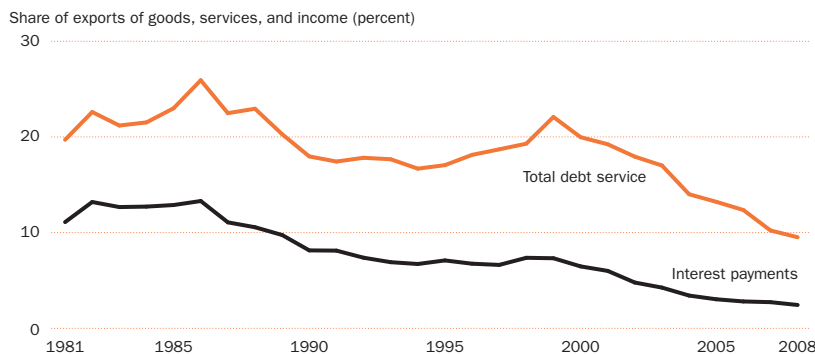

Debt ratios are used to assess the sustainability of a country's debt service obligations, but no absolute rules determine what values are too high. Empirical analysis of developing countries' experience and debt service performance shows that debt service difficulties become increasingly likely when the present value of debt reaches 200 percent of exports. Still, what constitutes a sustainable debt burden varies by country. Countries with fast-growing economies and exports are likely to be able to sustain higher debt levels.

## Definitions

- **Total external debt** is debt owed to nonresidents and comprises public, publicly guaranteed, and private nonguaranteed long-term debt, short-term debt, and use of IMF credit. It is presented as a share of GNI.
- **Total debt service** is the sum of principal repayments and interest actually paid in foreign currency, goods, or services on long-term debt; interest paid on short-term debt; and repayments (repurchases and charges) to the IMF.
- **Exports of goods, services, and income** refer to international transactions involving a change in ownership of general merchandise, goods sent for processing and repairs, nonmonetary gold, services, receipts of employee compensation for nonresident workers, investment income, and workers' remittances.
- **Multilateral debt service** is the repayment of principal and interest to the World Bank, regional development banks, and other multilateral and intergovernmental agencies.
- **Short-term debt** includes all debt having an original maturity of one year or less and interest in arrears on long-term debt.
- **Total reserves** comprise holdings of monetary gold, special drawing rights, reserves of IMF members held by the IMF, and holdings of foreign exchange under the control of monetary authorities.
- **Present value of debt** is the sum of short-term external debt plus the discounted sum of total debt service payments due on public, publicly guaranteed, and private nonguaranteed long-term external debt over the life of existing loans.

## The burden of external debt service declined over 2000–08

6.11a

The total external debt service of low- and middle-income economies fell from 20 percent of export revenues in 2000 to under 10 percent in 2008. About 26 percent of the total debt service in 2008 was interest payments on outstanding debt compared with 32 percent in 2000.

Source: Global Development Finance data files.

## Data sources

Data on external debt are mainly from reports to the World Bank through its Debtor Reporting System from member countries that have received IBRD loans or IDA credits, with additional information from the files of the World Bank, the IMF, the African Development Bank and African Development Fund, the Asian Development Bank and Asian Development Fund, and the Inter-American Development Bank. Data on GNI, exports of goods and services, and total reserves are from the World Bank's national accounts files and the IMF's Balance of Payments and International Financial Statistics databases. Summary tables of the external debt of developing countries are published annually in the World Bank's *Global Development Finance*, on its *Global Development Finance* CD-ROM, and on *GDF Online*.

## About the data

Private financial flows—equity and debt—account for the bulk of development finance. Equity flows comprise foreign direct investment (FDI) and portfolio equity. Debt flows are financing raised through bond issuance, bank lending, and supplier credits. Data on equity flows are based on balance of payments data reported by the International Monetary Fund (IMF). FDI data are supplemented by staff estimates using data from the United Nations Conference on Trade and Development and official national sources.

The internationally accepted definition of FDI (from the fifth edition of the IMF's *Balance of Payments Manual* [1993]), includes three components: equity investment, reinvested earnings, and short- and long-term loans between parent firms and foreign affiliates. Distinguished from other kinds of international investment, FDI is made to establish a lasting interest in or effective management control over an enterprise in another country. The IMF suggests that investments should account for at least 10 percent of voting stock to be counted as FDI. In practice many countries set a higher threshold. Many countries fail to report reinvested earnings, and the definition of long-term loans differs among countries.

FDI data do not give a complete picture of international investment in an economy. Balance of payments data on FDI do not include capital raised locally, an important source of investment financing in some developing countries. In addition, FDI data omit nonequity cross-border transactions such as intrafirm flows of goods and services. For a detailed discussion of the data issues, see the World Bank's *World Debt Tables 1993–94* (vol. 1, chap. 3).

Statistics on bonds, bank lending, and supplier credits are produced by aggregating transactions of public and publicly guaranteed debt and private nonguaranteed debt. Data on public and publicly guaranteed debt are reported through the Debtor Reporting System by World Bank member economies that have received loans from the International Bank for Reconstruction and Development or credits from the International Development Association. The reports are cross-checked with data from market sources that include transactions data. Information on private nonguaranteed bonds and bank lending is collected from market sources, because official national sources reporting to the Debtor Reporting System are not asked for a breakdown of private nonguaranteed bonds and loans.

Data on equity flows are shown for all countries for which data are available. Debt flows are shown only for 128 developing countries that report to the Debtor Reporting System; nonreporting countries may also receive debt flows.

The volume of global private financial flows reported by the World Bank generally differs from that reported by other sources because of differences in sources, classification of economies, and method used to adjust and disaggregate reported information. In addition, particularly for debt financing, differences may also reflect how some installments of the transactions and certain offshore issuances are treated.

## Definitions

• **Foreign direct investment** is net inflows of investment to acquire a lasting interest in or management control over an enterprise operating in an economy other than that of the investor. It is the sum of equity capital, reinvested earnings, other long-term capital, and short-term capital, as shown in the balance of payments. • **Portfolio equity** includes net inflows from equity securities other than those recorded as direct investment and including shares, stocks, depository receipts, and direct purchases of shares in local stock markets by foreign investors • **Bonds** are securities issued with a fixed rate of interest for a period of more than one year. They include net flows through cross-border public and publicly guaranteed and private nonguaranteed bond issues. • **Commercial bank and other lending** includes net commercial bank lending (public and publicly guaranteed and private nonguaranteed) and other private credits.

## Most global foreign direct investment is directed to high-income economies and a few large middle-income economies

6.12a

The share of FDI net inflows to developing economies increased 10 percentage points between 2007 and 2008 because of decreasing inflows to high-income economies. Brazil, China, India, the Russian Federation, and South Africa received more than half the FDI net inflows to all developing economies.

Source: World Development Indicators data files.

## Data sources

Data on equity and debt flows are compiled from a variety of public and private sources, including the World Bank's Debtor Reporting System, the IMF's International Financial Statistics and Balance of Payments databases, and Dealogic. These data are also published annually in the World Bank's *Global Development Finance*, on its *Global Development Finance* CD-ROM, and on *GDF Online*.

a. Aggregates include amounts for economies that do not report to the World Bank's Debtor Reporting System and may differ from aggregates published in *Global Development Finance 2010*.  
b. Aggregates include amounts for economies not specified elsewhere. c. World and income group aggregates include flows not allocated by country or region.

## About the data

The table shows concessional and nonconcessional financial flows from official bilateral sources, the major international financial institutions, and UN agencies. The international financial institutions fund nonconcessional lending operations primarily by selling low-interest, highly rated bonds backed by prudent lending and financial policies and the strong financial support of their members. Funds are then on-lent to developing countries at slightly higher interest rates with 15- to 20-year maturities. Lending terms vary with market conditions and institutional policies.

Concessional flows from international financial institutions are credits provided through concessional lending facilities. Subsidies from donors or other resources reduce the cost of these loans. Grants are not included in net flows. The Organisation for Economic Co-operation and Development's (OECD) Development Assistance Committee (DAC) defines concessional flows from bilateral donors as flows with a grant element of at least 25 percent, evaluated assuming a 10 percent nominal discount rate.

World Bank concessional lending is done by the International Development Association (IDA) based on gross national income (GNI) per capita and performance standards assessed by World Bank staff. Cut-off for IDA eligibility, set at the beginning of the World Bank's fiscal year, has been \$1,135 since July 1, 2009, measured in 2008 U.S. dollars using the *Atlas* method (see *Users guide*). In exceptional circumstances IDA extends temporary eligibility to countries above the cut-off that are undertaking major adjustments but are not

creditworthy for International Bank for Reconstruction and Development (IBRD) lending. Exceptions are also made for small island economies. The IBRD lends to creditworthy countries at a variable base rate of six-month LIBOR plus a spread, either variable or fixed, for the life of the loan. The rate is reset every six months and applies to the interest period beginning on that date. Although some outstanding IBRD loans have a low enough interest rate to be classified as concessional under the DAC definition, all IBRD loans in the table are classified as nonconcessional. Lending by the International Finance Corporation is not included.

The International Monetary Fund makes concessional funds available through its Poverty Reduction and Growth Facility and the IMF Trust Fund. Eligibility is based principally on a country's per capita income and eligibility under IDA.

Regional development banks also maintain concessional windows. Their loans are recorded in the table according to each institution's classification and not according to the DAC definition.

Data for flows from international financial institutions are available for 128 countries that report to the World Bank's Debtor Reporting System. World Bank flows for nonreporting countries were collected from its operational records. Nonreporting countries may have net flows from other international financial institutions.

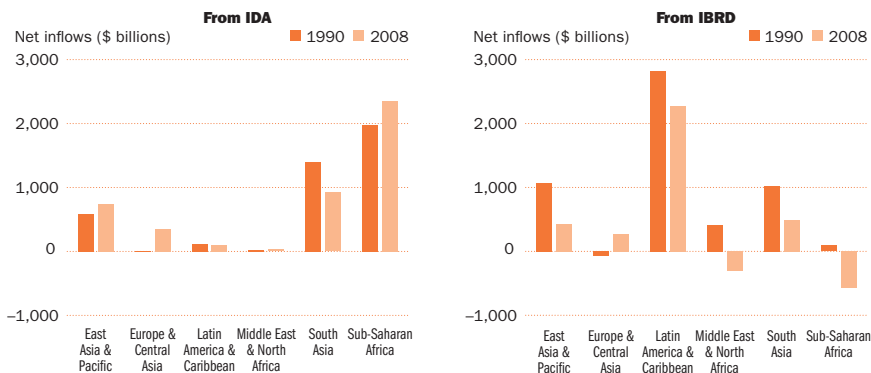

Official flows from the United Nations are mainly concessional flows classified as official development assistance but may include nonconcessional flows classified as other official flows in OECD-DAC databases.

## Definitions

- **Total net official financial flows** are disbursements of public or publicly guaranteed loans and credits, less repayments of principal.
- **IDA** is the International Development Association, the concessional loan window of the World Bank Group.
- **IBRD** is the International Bank for Reconstruction and Development, the founding and largest member of the World Bank Group.
- **IMF** is the International Monetary Fund, which provides concessional lending through the Poverty Reduction and Growth Facility and the IMF Trust Fund and nonconcessional lending through credit to its members, mainly for balance of payments needs.
- **Regional development banks** are the African Development Bank, which serves all of Africa, including North Africa; the Asian Development Bank, which serves South and Central Asia and East Asia and Pacific; the European Bank for Reconstruction and Development, which serves Europe and Central Asia; and the Inter-American Development Bank, which serves the Americas.
- **Concessional** financial flows are disbursements made through concessional lending facilities.
- **Nonconcessional** financial flows are all disbursements that are not concessional.
- **Other institutions**, a residual category in the World Bank's Debtor Reporting System, includes other multilateral institutions such as the Caribbean Development Fund, Council of Europe, European Development Fund, Islamic Development Bank, and Nordic Development Fund.
- **United Nations** includes the United Nations Children's Fund (UNICEF), United Nations Relief and Works Agency for Palestine Refugees in the Near East (UNRWA), United Nations Regular Programme for Technical Assistance (UNTA), and other UN agencies, such as the International Fund for Agricultural Development, Joint United Nations Programme on HIV/AIDS, United Nations Development Programme, United Nations Population Fund, United Nations Refugee Agency, and World Food Programme.

### Net lending from the International Bank for Reconstruction and Development declined as countries paid off loans, and concessional lending from the International Development Association increased

6.13a

All regions except Middle East and North Africa and Sub-Saharan Africa received positive net disbursements from the IBRD. The world's poorest countries in Sub-Saharan Africa continue to receive concessional lending from the International Development Association.

## About the data

The flows of official and private financial resources from the members of the Development Assistance Committee (DAC) of the Organisation for Economic Co-operation and Development (OECD) to developing economies are compiled by DAC, based principally on reporting by DAC members using standard questionnaires issued by the DAC Secretariat.

The table shows data reported by DAC member economies and does not include aid provided by the European Commission—a multilateral member of DAC.

DAC exists to help its members coordinate their development assistance and to encourage the expansion and improve the effectiveness of the aggregate resources flowing to recipient economies. In this capacity DAC monitors the flow of all financial resources, but its main concern is official development assistance (ODA). Grants or loans to countries and territories on the DAC list of aid recipients have to meet three criteria to be counted as ODA. They are undertaken by the official sector. They promote economic development and welfare as the main objective. And they are provided on concessional financial terms (loans must have a grant element of at least 25 percent, calculated at a discount rate of 10 percent). The DAC Statistical Reporting Directives provide the most detailed explanation of this definition and all ODA-related rules.

This definition excludes nonconcessional flows from official creditors, which are classified as “other official flows,” and aid for military purposes. Transfer payments to private individuals, such as pensions, reparations, and insurance payouts, are in general not counted. In addition to financial flows, ODA includes technical cooperation, most expenditures for peacekeeping under UN mandates and assistance to refugees, contributions to multilateral institutions such as the United Nations and its specialized agencies, and concessional funding to multilateral development banks.

A DAC revision of the list of countries and territories counted as aid recipients has governed aid reporting for the three years starting in 2005. In the past DAC distinguished aid going to Part I and Part II countries. Part I countries, the recipients of ODA, comprised many of the countries classified by the World Bank as low- and middle-income economies. Part II countries, whose assistance was designated official aid, included the more advanced countries of Central and Eastern Europe, countries of the former Soviet Union, and certain advanced developing countries and territories. This distinction has been

dropped. ODA recipients now comprise all low- and middle-income countries except those that are members of the Group of Eight or the European Union (including countries with a firm date for EU accession). The content and structure of tables 6.14–6.17 were revised to reflect this change. Because official aid flows are quite small relative to ODA, the net effect of these changes is believed to be minor.

Flows are transfers of resources, either in cash or in the form of commodities or services measured on a cash basis. Short-term capital transactions (with one year or less maturity) are not counted. Repayments of the principal (but not interest) of ODA loans are recorded as negative flows. Proceeds from official equity investments in a developing country are reported as ODA, while proceeds from their later sale are recorded as negative flows.

The table is based on donor country reports and does not provide a complete picture of the resources received by developing economies for two reasons. First, flows from DAC members are only part of the aggregate resource flows to these economies. Second, the data that record contributions to multilateral institutions measure the flow of resources made available to those institutions by DAC members, not the flow of resources from those institutions to developing and transition economies.

Aid as a share of gross national income (GNI), aid per capita, and ODA as a share of the general government disbursements of the donor are calculated by the OECD. The denominators used in calculating these ratios may differ from corresponding values elsewhere in this book because of differences in timing or definitions.

## Definitions

- **Net disbursements** are gross disbursements of grants and loans minus repayments of principal on earlier loans.
- **Total net flows** are ODA or official aid flows, other official flows, private flows, and net grants by nongovernmental organizations.
- **Official development assistance** refers to flows that meet the DAC definition of ODA and are made to countries and territories on the DAC list of aid recipients.
- **Bilateral grants** are transfers of money or in kind for which no repayment is required.
- **Bilateral loans** are loans extended by governments or official agencies with a grant element of at least 25 percent (at a 10 percent discount rate).
- **Contributions to multilateral institutions** are concessional funding received by multilateral institutions from DAC members as grants or capital subscriptions.
- **Other official flows**

are transactions by the official sector whose main objective is other than development or whose grant element is less than 25 percent.

- **Private flows** are flows at market terms financed from private sector resources in donor countries. They include changes in holdings of private long-term assets by reporting country residents.
- **Foreign direct investment** is investment by residents of DAC member countries to acquire a lasting management interest (at least 10 percent of voting stock) in an enterprise operating in the recipient country. The data reflect changes in the net worth of subsidiaries in recipient countries whose parent company is in the DAC source country.
- **Bilateral portfolio investment** is bank lending and the purchase of bonds, shares, and real estate by residents of DAC member countries in recipient countries.
- **Multilateral portfolio investment** is transactions of private banks and nonbanks in DAC member countries in the securities issued by multilateral institutions.
- **Private export credits** are loans extended to recipient countries by the private sector in DAC member countries to promote trade; they may be supported by an official guarantee.
- **Net grants by nongovernmental organizations (NGOs)** are private grants by NGOs, net of subsidies from the official sector.
- **Commitments** are obligations, expressed in writing and backed by funds, undertaken by an official donor to provide specified assistance to a recipient country or multilateral organization.
- **Gross disbursements** are the international transfer of financial resources, goods, and services, valued at the cost to the donor.

## Data sources

Data on financial flows are compiled by OECD DAC and published in its annual statistical report, *Geographical Distribution of Financial Flows to Developing Countries*, and its annual *Development Co-operation Report*. Data are available electronically on the OECD-DAC's *International Development Statistics* CD-ROM and at [www.oecd.org/dac/stats/idsonline](http://www.oecd.org/dac/stats/idsonline).

a. At current exchange rates and prices. b. Includes aid for promoting development awareness and aid provided to refugees in donor economies.

## About the data

Aid can be used in many ways. The sector to which aid goes, the form it takes, and the procurement restrictions attached to it are important influences on aid effectiveness. The data on allocation of official development assistance (ODA) in the table are based principally on reporting by members of the Organisation for Economic Co-operation and Development (OECD) Development Assistance Committee (DAC). For more detailed explanation of ODA, see *About the data* for table 6.14.

The form in which an ODA contribution reaches the benefiting sector or the economy is important. A distinction is made between resource provision and technical cooperation. Resource provision involves mainly cash or in-kind transfers and financing of capital projects, with the deliverables being financial support and the provision of commodities and supplies. Technical cooperation includes grants to nationals of aid-recipient countries receiving education or training at home or abroad, and payments to consultants, advisers, and similar personnel and to teachers and administrators serving in recipient countries. Technical cooperation is spent mostly in the donor economy.

Two other types of aid are presented because they serve distinctive purposes. Debt-related aid aims to

provide debt relief on liabilities that recipient countries have difficulty servicing. Thus, this type of aid may not provide a full value of new resource flows for development, in particular for heavily indebted poor countries. Humanitarian assistance provides relief following sudden disasters and supports food programs in emergency situations. This type of aid does not generally contribute to financing long-term development.

## Definitions

- **Net disbursements** are gross disbursements of grants and loans minus repayments of principal on earlier loans
- **Development projects, programs, and other resource provisions** are aid provided as cash transfers, aid in kind, development food aid, and the financing of capital projects, intended to increase or improve the recipient's stock of physical capital and to support recipient's development plans and other activities with finance and commodity supply.
- **Technical cooperation** is the provision of resources whose main aim is to augment the stock of human intellectual capital, such as the level of knowledge, skills, and technical know-how in the recipient country (including the cost of associated equipment). Contributions take the form mainly of the supply of

human resources from donors or action directed to human resources (such as training or advice). Also included are aid for promoting development awareness and aid provided to refugees in the donor economy. Assistance specifically to facilitate a capital project is not included.

- **Debt-related aid** groups all actions relating to debt, including forgiveness, swaps, buybacks, rescheduling, and refinancing.
- **Humanitarian assistance** is emergency and distress relief (including aid to refugees and assistance for disaster preparedness).
- **Administrative costs** are the total current budget outlays of institutions responsible for the formulation and implementation of donor's aid programs and other administrative costs incurred by donors in aid delivery.

## Data sources

Data on aid flows are published by OECD DAC in its annual statistical report, *Geographical Distribution of Financial Flows to Developing Countries*, and its annual *Development Co-operation Report*. Data are available electronically on the OECD DAC's *International Development Statistics* CD-ROM and at [www.oecd.org/dac/stats/idsonline](http://www.oecd.org/dac/stats/idsonline).

# Allocation of bilateral aid from Development Assistance Committee members

a. Excludes technical cooperation and administrative costs. b. Gross disbursements.

### About the data

The Development Assistance Committee (DAC) records the sector classification of aid using a three-level hierarchy. The top level is grouped by themes, such as social infrastructure and services; economic infrastructure, services, and production; and multisector or cross-cutting areas. The second level is more specific. Education and health and transport and storage are examples. The third level comprises subsectors such as basic education and basic health. Some contributions are reported as non-sector-allocable aid.

Reporting on the sectoral destination and the form of aid by donors may not be complete. Also, measures of aid allocation may differ from the perspectives of donors and recipients because of difference in classification, available information, and recording time.

The proportion of untied aid is reported because tying arrangements may prevent recipients from obtaining the best value for their money. Tying requires recipients to purchase goods and services from the donor country or from a specified group of countries. Such arrangements prevent a recipient from misappropriating or mismanaging aid receipts, but they may also be motivated by a desire to benefit donor country suppliers.

### Definitions

- **Bilateral official development assistance (ODA) commitments** are firm obligations, expressed in writing and backed by the necessary funds, undertaken by official bilateral donors to provide specified assistance to a recipient country or a multilateral organization. Bilateral commitments are recorded in the full amount of expected transfer, irrespective of the time required for completing disbursements.
- **Total sector-allocable aid** is the sum of aid that can be assigned to specific sectors or multisector activities.
- **Social infrastructure and services** refer to efforts to develop the human resources potential of aid recipients.
- **Education** refers to general teaching and instruction at all levels, as well as construction to improve or adapt educational establishments. Training in a particular field is reported for the sector concerned.
- **Health** refers to assistance to hospitals, clinics, other medical and dental services, public health administration, and medical insurance programs.
- **Population** refers to all activities related to family planning and research into population problems.
- **Water supply and sanitation** refer to assistance for water supply and use, sanitation, and water resources development (including rivers).
- **Government and civil society** refer to assistance to strengthen government administrative apparatus

and planning and activities promoting good governance and civil society.

- **Economic infrastructure, services, and production sector** group assistance for networks, utilities, services that facilitate economic activity, and contributions to all directly productive sectors.
- **Transport and communication** refer to road, rail, water, and air transport; post and telecommunications; and television and print media.
- **Agriculture** refers to sector policy, development, and inputs; crop and livestock production; and agricultural credit, cooperatives, and research.
- **Multisector or cross-cutting** refers to support for projects that straddle several sectors.
- **Untied aid** is ODA not subject to restrictions by donors on procurement sources.

### Data sources

Data on aid flows are published annually by the Organisation for Economic Co-operation and Development (OECD) DAC in *Geographical Distribution of Financial Flows to Developing Countries and Development Co-operation Report*. Data are available electronically on the OECD DAC's *International Development Statistics* CD-ROM and at [www.oecd.org/dac/stats/idsonline](http://www.oecd.org/dac/stats/idsonline).

**Note:** Regional aggregates include data for economies not listed in the table. World and income group totals include aid not allocated by country or region—including administrative costs, research on development issues, and aid to nongovernmental organizations. Thus regional and income group totals do not sum to the world total.  
a. Includes Montenegro.

## About the data

Unless otherwise noted, aid includes official development assistance (ODA; see *About the data* for table 6.14). The data cover loans and grants from Development Assistance Committee (DAC) member countries, multilateral organizations, and non-DAC donors. They do not reflect aid given by recipient countries to other developing countries. As a result, some countries that are net donors (such as Saudi Arabia) are shown in the table as aid recipients (see table 6.16a). Aid given before 2005 to countries that were Part II recipients (see *About the data* for table 6.14 for more information) is defined as official aid.

The table does not distinguish types of aid (program, project, or food aid; emergency assistance; postconflict peacekeeping assistance; or technical cooperation), which may have different effects on the economy. Expenditures on technical cooperation do not always directly benefit the economy to the extent that they defray costs incurred outside the country on salaries and benefits of technical experts and overhead costs of firms supplying technical services.

Ratios of aid to gross national income (GNI), gross capital formation, imports, and government spending

provide measures of recipient country dependency on aid. But care must be taken in drawing policy conclusions. For foreign policy reasons some countries have traditionally received large amounts of aid. Thus aid dependency ratios may reveal as much about a donor's interests as about a recipient's needs. Ratios are generally much higher in Sub-Saharan Africa than in other regions, and they increased in the 1980s. High ratios are due only in part to aid flows. Many African countries saw severe erosion in their terms of trade in the 1980s, which, along with weak policies, contributed to falling incomes, imports, and investment. Thus the increase in aid dependency ratios reflects events affecting both the numerator (aid) and the denominator (GNI).

Because the table relies on information from donors, it is not necessarily consistent with information recorded by recipients in the balance of payments, which often excludes all or some technical assistance—particularly payments to expatriates made directly by the donor. Similarly, grant commodity aid may not always be recorded in trade data or in the balance of payments. Moreover, DAC statistics exclude purely military aid.

The nominal values used here may overstate the real value of aid to recipients. Changes in international prices and exchange rates can reduce the purchasing power of aid. Tying aid, still prevalent though declining in importance, also tends to reduce its purchasing power (see *About the data* for table 6.15).

The aggregates refer to World Bank definitions. Therefore the ratios shown may differ from those of the Organisation for Economic Co-operation and Development (OECD).

## Definitions

• **Net official development assistance** is flows (net of repayment of principal) that meet the DAC definition of ODA and are made to countries and territories on the DAC list of aid recipients. See *About the data* for table 6.14. • **Net official development assistance per capita** is net ODA divided by midyear population.

• **Aid dependency ratios** are calculated using values in U.S. dollars converted at official exchange rates. Imports of goods, services, and income refer to international transactions involving a change in ownership of general merchandise, goods sent for processing and repairs, nonmonetary gold, services, receipts of employee compensation for nonresident workers, and investment income. For definitions of GNI, gross capital formation, and central government expense, see *Definitions* for tables 1.1, 4.8, and 4.10.

## Official development assistance from non-DAC donors, 2004–08

**Note:** The table does not reflect aid provided by several major emerging non–Organisation for Economic Co-operation and Development donors because information on their aid has not been disclosed.

a. The Republic of Korea became a DAC member in November 2009. Its disbursements will be reflected in DAC data beginning with 2010 flows. b. Includes \$47.9 million in 2004, \$49.2 million in 2005, \$45.5 million in 2006, \$42.9 million in 2007, and \$43.0 million in 2008 for first-year sustenance expenses for people arriving from developing countries (many of which are experiencing civil war or severe unrest) or people who have left their country for humanitarian or political reasons. Source: Organisation for Economic Co-operation and Development.

## Data sources

Data on financial flows are compiled by OECD DAC and published in its annual statistical report, *Geographical Distribution of Financial Flows to Developing Countries*, and in its annual *Development Co-operation Report*. Data are available electronically on the OECD DAC's *International Development Statistics* CD-ROM and at [www.oecd.org/dac/stats/idsonline](http://www.oecd.org/dac/stats/idsonline). Data on population, GNI, gross capital formation, imports of goods and services, and central government expense used in computing the ratios are from World Bank and International Monetary Fund databases.

Note: Regional aggregates include data for economies not specified elsewhere. World and income group totals include aid not allocated by country or region.

## About the data

The table shows net bilateral aid to low- and middle-income economies from members of the Development Assistance Committee (DAC) of the Organisation for Economic Co-operation and Development (OECD). The data include aid to some countries and territories not shown in the table and aid to unspecified economies recorded only at the regional or global level. Aid to countries and territories not shown in the table has been assigned to regional totals based on the World Bank's regional classification system. Aid to unspecified economies is included in regional totals and, when possible, income group totals. Aid not allocated by country or region—including administrative costs, research on development, and aid to nongovernmental organizations—is included in the world total. Thus regional and income group totals do not sum to the world total.

The table is based on donor country reports of bilateral programs, which may differ from reports by recipient countries. Recipients may lack access to information on such aid expenditures as development-oriented research, stipends and tuition costs for aid-financed students in donor countries,

and payment of experts hired by donor countries. Moreover, a full accounting would include donor country contributions to multilateral institutions, the flow of resources from multilateral institutions to recipient countries, and flows from countries that are not members of DAC. Previous editions of the table included only DAC member economies. The table also includes net aid from the European Commission—a multilateral member of DAC.

The expenditures that countries report as official development assistance (ODA) have changed. For example, some DAC members have reported as ODA the aid provided to refugees during the first 12 months of their stay within the donor's borders.

Some of the aid recipients shown in the table are also aid donors. See table 6.16a for a summary of ODA from non-DAC countries.

## Definitions

• **Net aid** refers to net bilateral official development assistance that meets the DAC definition of official development assistance and is made to countries and territories on the DAC list of aid recipients. See *About the data* for table 6.14. • **Other DAC donors** are Australia, Austria, Belgium, Denmark, Finland, Greece, Ireland, Italy, Luxembourg, New Zealand, Norway, Portugal, and Switzerland.

## Destination of aid varies by donor

**6.17a**

Share of bilateral official development assistance net disbursements, 2008

■ East Asia & Pacific
 ■ Europe & Central Asia
 ■ Latin America & Caribbean
 ■ Middle East & North Africa
 ■ South Asia
 ■ Sub-Saharan Africa

In 2008 Sub-Saharan Africa received 38 percent of total bilateral net official development assistance disbursements from Development Assistance Committee (DAC) donors, and the Middle East and North Africa received 22 percent. However, destinations of aid vary by donor.

**Note:** Data are the distribution of bilateral aid from the top six DAC donors in 2008 and exclude aid to high-income economies (less than 1 percent of bilateral aid) and aid unallocated by region.

**Source:** Organisation for Economic Co-operation and Development, Development Assistance Committee.

## Data sources

Data on financial flows are compiled by OECD DAC and published in its annual statistical report, *Geographical Distribution of Financial Flows to Developing Countries*, and its annual *Development Co-operation Report*. Data are available electronically on the OECD DAC's *International Development Statistics* CD-ROM and at [www.oecd.org/dac/stats/idsonline](http://www.oecd.org/dac/stats/idsonline).

a. World Bank estimates. b. Includes Taiwan, China. c. Includes Tibetans, who are listed separately by the UN Refugee Agency (UNHCR). d. Includes Palestinian refugees under the mandate of the United Nations Relief and Works Agency for Palestine Refugees in the Near East (UNRWA), who are not included in data from the UNHCR. e. Includes Montenegro. f. World totals computed by the United Nations sum to zero, but because the aggregates refer to World Bank definitions, regional and income group totals do not. g. World totals are computed by the World Bank and include only economies covered by *World Development Indicators*, so data may differ from what is published by the United Nations Population Division. h. Includes refugees without specified country of origin and Palestinian refugees under the mandate of the UNRWA, so regional and income group totals do not sum to the world total.

### About the data

Movement of people, most often through migration, is a significant part of global integration. Migrants contribute to the economies of both their host country and their country of origin. Yet reliable statistics on migration are difficult to collect and are often incomplete, making international comparisons a challenge.

The United Nations Population Division provides data on net migration and migrant stock. To derive estimates of net migration, the organization takes into account the past migration history of a country or area, the migration policy of a country, and the influx of refugees in recent periods. The data to calculate these official estimates come from a variety of sources, including border statistics, administrative records, surveys, and censuses. When no official estimates can be made because of insufficient data, net migration is derived through the balance equation, which is the difference between overall population growth and the natural increase during the 1990–2000 intercensal period.

The data used to estimate the international migrant stock at a particular time are obtained mainly from population censuses. The estimates are derived from the data on foreign-born population—people who have residence in one country but were born in another country. When data on the foreign-born population are not available, data on foreign population—that is, people who are citizens of a country other than the country in which they reside—are used as estimates.

After the breakup of the Soviet Union in 1991 people living in one of the newly independent countries who were born in another were classified as international migrants. Estimates of migrant stock in the newly independent states from 1990 on are based on the 1989 census of the Soviet Union.

For countries with information on the international migrant stock for at least two points in time, interpolation or extrapolation was used to estimate the international migrant stock on July 1 of the reference years. For countries with only one observation, estimates for the reference years were derived using rates of change in the migrant stock in the years preceding or following the single observation available. A model was used to estimate migrants for countries that had no data.

Registrations, together with other sources—including estimates and surveys—are the main sources of refugee data. But there are difficulties in collecting accurate statistics. Although refugees are often registered individually, the accuracy of

registrations varies greatly. Many refugees may not be aware of the need to register or may choose not to do so. And administrative records tend to overestimate the number of refugees because it is easier to register than to de-register. The UN Refugee Agency (UNHCR) collects and maintains data on refugees, except for Palestinian refugees residing in areas under the mandate of the United Nations Relief and Works Agency for Palestine Refugees in the Near East (UNRWA). The UNRWA provides services to Palestinian refugees who live in certain areas and who register with the agency. Registration is voluntary, and estimates by the UNRWA are not an accurate count of the Palestinian refugee population. The table shows estimates of refugees collected by the UNHCR, complemented by estimates of Palestinian refugees under the UNRWA mandate. Thus, the aggregates differ from those published by the UNHCR.

Workers' remittances and compensation of employees are World Bank staff estimates based on data from the International Monetary Fund's (IMF) *Balance of Payments Statistics Yearbook*. The IMF data are supplemented by World Bank staff estimates for missing data for countries where workers' remittances are important. The data reported here are the sum of three items defined in the fifth edition of the IMF's *Balance of Payments Manual*: workers' remittances, compensation of employees, and migrants' transfers.

The distinction among these three items is not always consistent in the data reported by countries to the IMF. In some cases countries compile data on the basis of the citizenship of migrant workers rather than their residency status. Some countries also report remittances entirely as workers' remittances or compensation of employees. Following the fifth edition of the *Balance of Payments Manual* in 1993, migrants' transfers are considered a capital transaction, but previous editions regarded them as current transfers. For these reasons the figures presented in the table take all three items into account.

### Definitions

- **Net migration** is the net total of migrants during the period. It is the total number of immigrants less the total number of emigrants, including both citizens and noncitizens. Data are five-year estimates.
- **International migrant stock** is the number of people born in a country other than that in which they live. It includes refugees.
- **Refugees** are people who are recognized as refugees under the 1951 Convention Relating to the Status of Refugees or its 1967 Protocol, the 1969 Organization of African Unity Convention Governing the Specific Aspects of Refugee Problems in Africa, people recognized as refugees in accordance with the UNHCR statute, people granted refugee-like humanitarian status, and people provided temporary protection. Asylum seekers—people who have applied for asylum or refugee status and who have not yet received a decision or who are registered as asylum seekers—are excluded. Palestinian refugees are people (and their descendants) whose residence was Palestine between June 1946 and May 1948 and who lost their homes and means of livelihood as a result of the 1948 Arab-Israeli conflict.
- **Country of origin** refers to the nationality or country of citizenship of a claimant.
- **Country of asylum** is the country where an asylum claim was filed and granted.
- **Workers' remittances and compensation of employees** received and paid comprise current transfers by migrant workers and wages and salaries earned by nonresident workers. Remittances are classified as current private transfers from migrant workers resident in the host country for more than a year, irrespective of their immigration status, to recipients in their country of origin. Migrants' transfers are defined as the net worth of migrants who are expected to remain in the host country for more than one year that is transferred to another country at the time of migration. Compensation of employees is the income of migrants who have lived in the host country for less than a year.

### Data sources

Data on net migration are from the United Nations Population Division's *World Population Prospects: The 2008 Revision*. Data on migration stock are from the United Nations Population Division's *Trends in Total Migrant Stock: The 2008 Revision*. Data on refugees are from the UNHCR's *Statistical Yearbook 2008*, complemented by statistics on Palestinian refugees under the mandate of the UNRWA as published on its website. Data on remittances are World Bank staff estimates based on IMF balance of payments data.

**Note:** Aggregates are based on World Bank country classifications and differ from those of the World Tourism Organization. Regional and income group totals include countries not shown in the table for which data are available.

a. Arrivals of nonresident visitors at national borders. b. Includes nationals residing abroad. c. Country estimates. d. Arrivals in all types of accommodation establishments. e. Expenditure of travel related items only; excludes passenger transport items. f. Arrivals in hotels and similar establishments. g. Arrivals by air only. h. Excludes nationals residing abroad. i. Arrivals in hotels only.

## About the data

Tourism is defined as the activities of people traveling to and staying in places outside their usual environment for no more than one year for leisure, business, and other purposes not related to an activity remunerated from within the place visited. The social and economic phenomenon of tourism has grown substantially over the past quarter century.

Statistical information on tourism is based mainly on data on arrivals and overnight stays along with balance of payments information. These data do not completely capture the economic phenomenon of tourism or provide the information needed for effective public policies and efficient business operations. Data are needed on the scale and significance of tourism. Information on the role of tourism in national economies is particularly deficient. Although the World Tourism Organization reports progress in harmonizing definitions and measurement, differences in national practices still prevent full comparability.

The data in the table are from the World Tourism Organization, a United Nations agency. The data on inbound and outbound tourists refer to the number of arrivals and departures, not to the number of people traveling. Thus a person who makes several trips to a country during a given period is counted each time as a new arrival. Unless otherwise indicated in the footnotes, the data on inbound tourism show the arrivals of nonresident tourists (overnight visitors) at national borders. When data on international tourists

are unavailable or incomplete, the table shows the arrivals of international visitors, which include tourists, same-day visitors, cruise passengers, and crew members.

Sources and collection methods for arrivals differ across countries. In some cases data are from border statistics (police, immigration, and the like) and supplemented by border surveys. In other cases data are from tourism accommodation establishments. For some countries number of arrivals is limited to arrivals by air and for others to arrivals staying in hotels. Some countries include arrivals of nationals residing abroad while others do not. Caution should thus be used in comparing arrivals across countries.

The World Tourism Organization is improving its coverage of tourism expenditure data, using balance of payments data from the International Monetary Fund (IMF) supplemented by data from individual countries. These data, shown in the table, include travel and passenger transport items as defined in the IMF's (1993) *Balance of Payments Manual*. When the IMF does not report data on passenger transport items, expenditure data for travel items are shown.

The aggregates are calculated using the World Bank's weighted aggregation methodology (see *Statistical methods*) and differ from the World Tourism Organization's aggregates.

## Definitions

• **International inbound tourists** (overnight visitors) are the number of tourists who travel to a country other than that in which they usually reside, and outside their usual environment, for a period not exceeding 12 months and whose main purpose in visiting is other than an activity remunerated from within the country visited. When data on number of tourists are not available, the number of visitors, which includes tourists, same-day visitors, cruise passengers, and crew members, is shown instead. • **International outbound tourists** are the number of departures that people make from their country of usual residence to any other country for any purpose other than an activity remunerated in the country visited. • **Inbound tourism expenditure** is expenditures by international inbound visitors, including payments to national carriers for international transport. These receipts include any other prepayment made for goods or services received in the destination country. They may include receipts from same-day visitors, except when these are important enough to justify separate classification. For some countries they do not include receipts for passenger transport items. Their share in exports is calculated as a ratio to exports of goods and services (all transactions between residents of a country and the rest of the world involving a change of ownership from residents to nonresidents of general merchandise, goods sent for processing and repairs, nonmonetary gold, and services). • **Outbound tourism expenditure** is expenditures of international outbound visitors in other countries, including payments to foreign carriers for international transport. These expenditures may include those by residents traveling abroad as same-day visitors, except when these are important enough to justify separate classification. For some countries they do not include expenditures for passenger transport items. Their share in imports is calculated as a ratio to imports of goods and services (all transactions between residents of a country and the rest of the world involving a change of ownership from nonresidents to residents of general merchandise, goods sent for processing and repairs, nonmonetary gold, and services).

## High-income economies remain the main recipients of increased international tourism expenditure, but the share of developing economies' receipts has risen 6.19a

Although more than 70 percent of international tourism expenditures went to high-income economies in 2008, the share of developing economies' receipts has increased since 1995. The share of receipts by East Asia and Pacific and Europe and Central Asia increased the most—about 3 percentage points.

## Data sources

Data on visitors and tourism expenditure are from the World Tourism Organization's *Yearbook of Tourism Statistics* and *Compendium of Tourism Statistics 2010*. Data in the table are updated from electronic files provided by the World Tourism Organization. Data on exports and imports are from the IMF's *Balance of Payments Statistics Yearbook* and data files.
